

AMAZON PILOT · SAFEWAVE WATCH 0.1 · GALAXY WATCH6 · SAFEWAVE FOR BUSINESS · ENTERPRISE DASHBOARD

Safewave Watch Demo for Amazon

A 31-page walkthrough of the system for floors where associates can't carry a phone. Chapter 1 sets up a Galaxy Watch6: site Wi-Fi, opening Safewave, the pairing code from the dashboard, the band, kiosk lock. Chapter 2 runs the pilot with the real dashboard beside Safewave for Business on an iPhone and the watch: Notify, the alert on the wrist, a life-safety alert, and what the dashboard shows when the band or the Wi-Fi drops.

Every dashboard, phone and watch screen in this document is the real one. Tap **Next** to begin, or **Contents** to jump to a step.

Chapter 2 · Dashboard, phone and watch side by side

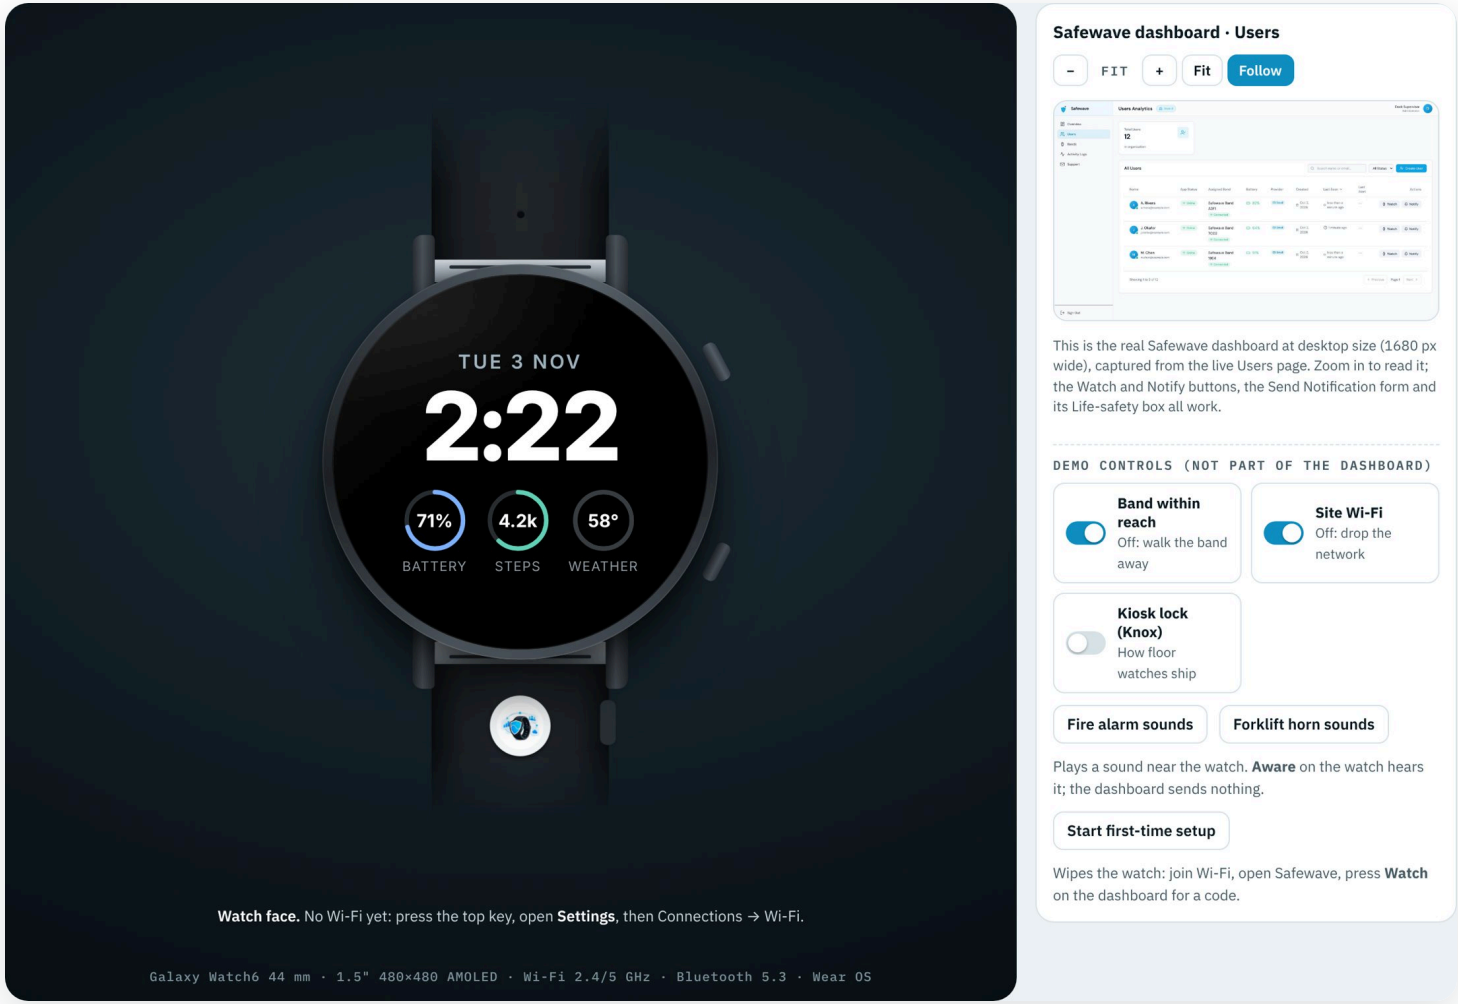

16 The whole system, side by side
17 Phone + band: the supervisor presses Notify
18 Write the alert and send it
19 The phone shows it; the band buzzes
20 Watch + band: no phones on the Amazon floor
21 A life-safety alert
22 The band walks away
23 Wi-Fi drops, then comes back
24 An alert wakes a dark watch
25 Acknowledged on the dashboard
26 That's the whole loop

Chapter 3 · Safewave Aware on the phone

27 Aware on the phone: start listening
28 A fire alarm is heard
29 Choose the sounds
30 One sound in detail
31 Teach it your site’s sounds

A brand-new watch

This is the Galaxy Watch6 an Amazon associate will wear, with the Gen 1 Safewave band clipped on. Fresh out of the box: no Wi-Fi yet, Safewave installed but not signed in. Setup takes about two minutes, once per watch.

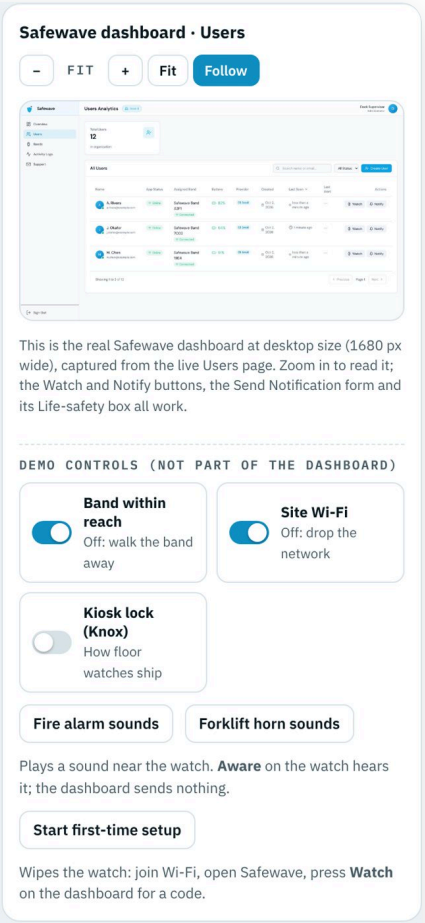

Watch face. No Wi-Fi yet: press the top key, open Settings, then Connections → Wi-Fi.

Join the site Wi-Fi: open Settings

The watch reaches the dashboard over Wi-Fi, so that comes first. Press the top key for the app list and tap Settings.

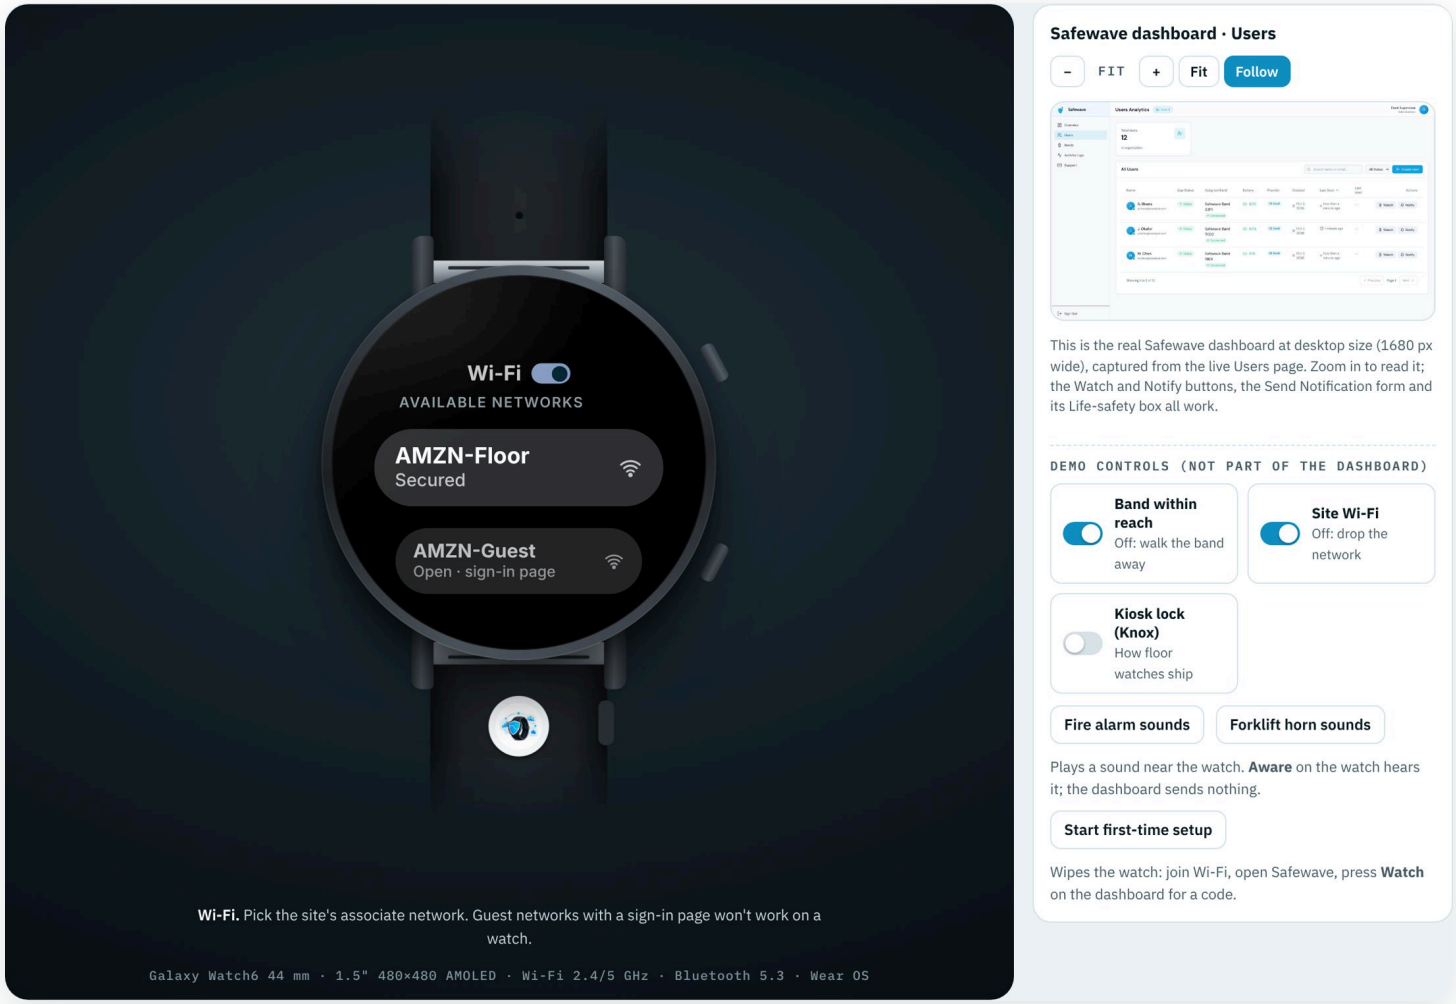

Settings. Wi-Fi lives under Connections. Scroll the list with a swipe.

Connections, then Wi-Fi

Same path as on any Galaxy Watch: Settings → Connections → Wi-Fi.

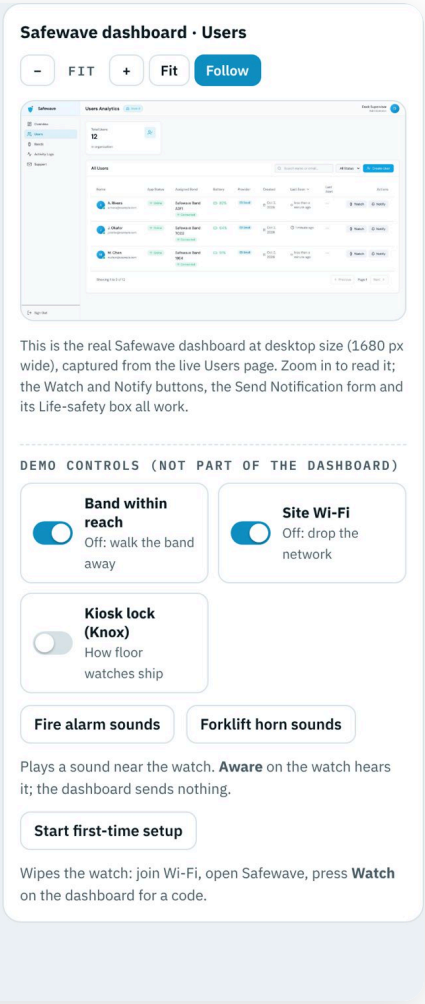

Wi-Fi. Pick the site's associate network. Guest networks with a sign-in page won't work on a watch.

Pick the site network and type the password

Choose the building's associate network, AMZN-Floor in this demo (a guest network with a sign-in page won't work on a watch), type the password once, and connect. The watch remembers it and rejoins by itself every shift.

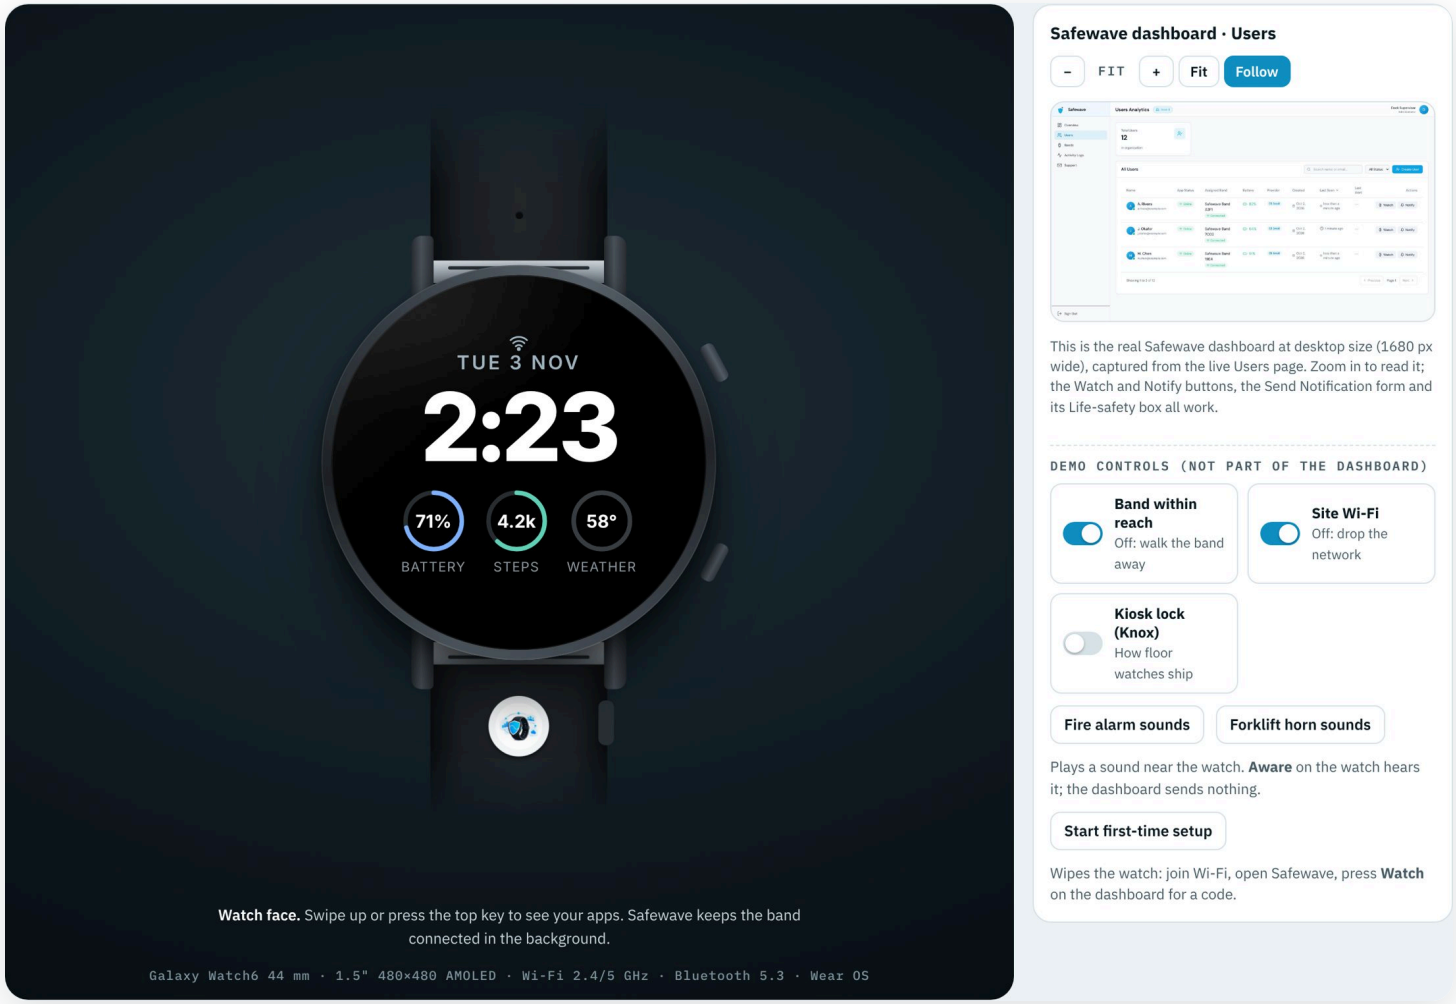

Connected to AMZN-Floor. Press the bottom key three times, or the top key once, to get back to the watch face.

Back to the watch face

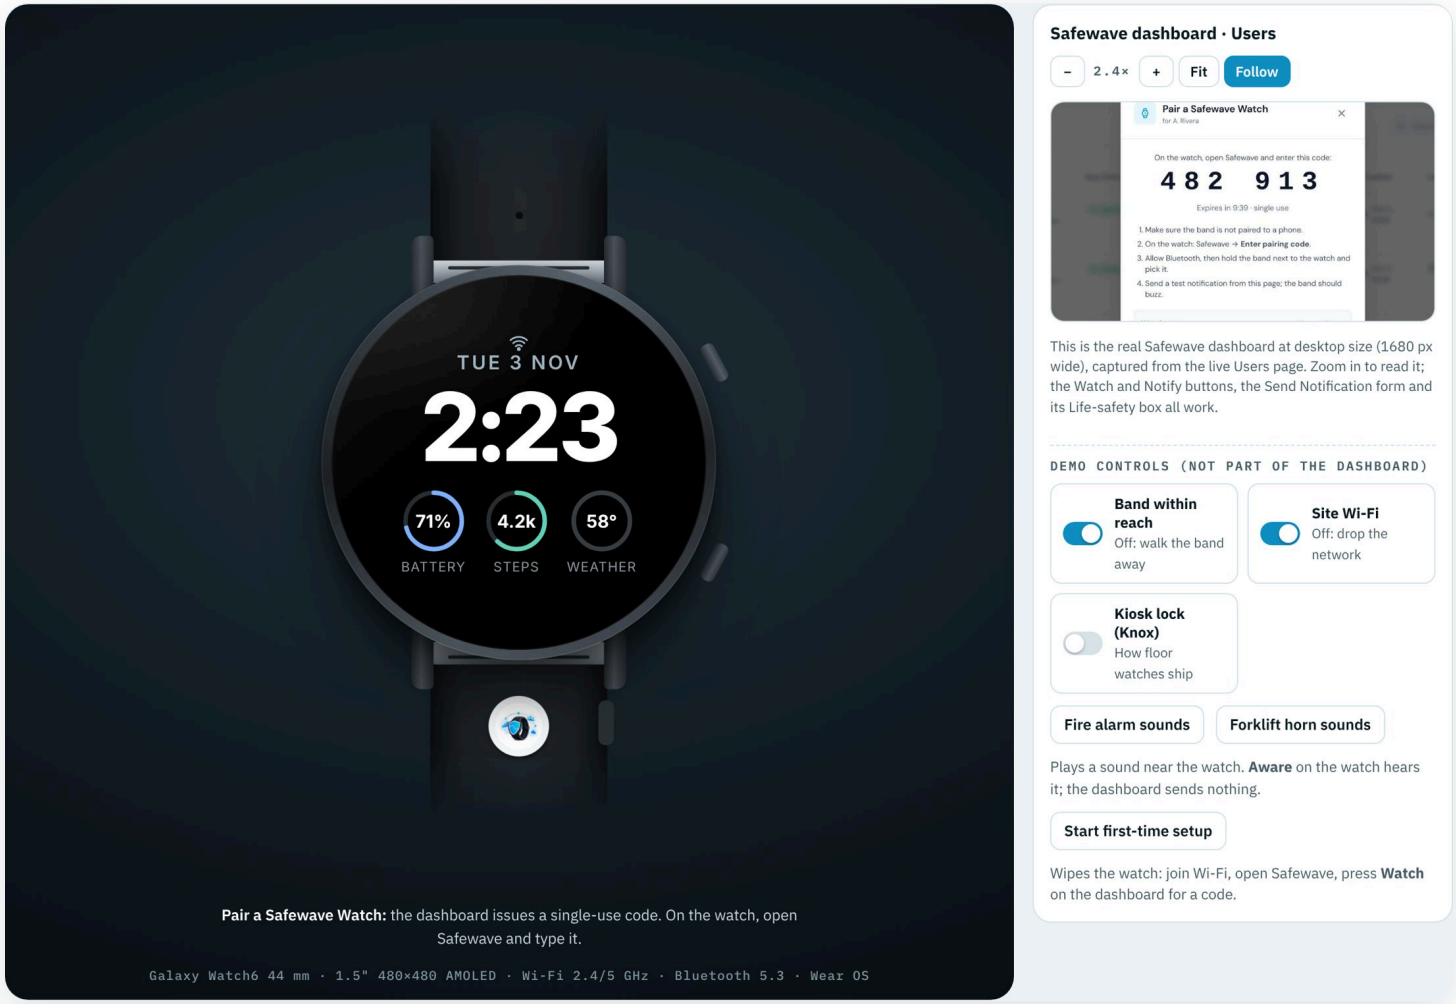

The top key takes you home from anywhere. The small Wi-Fi mark at the top of the face shows the watch is on the network.

Watch face. Swipe up or press the top key to see your apps. Safewave keeps the band connected in the background.

On the dashboard: Watch → pairing code

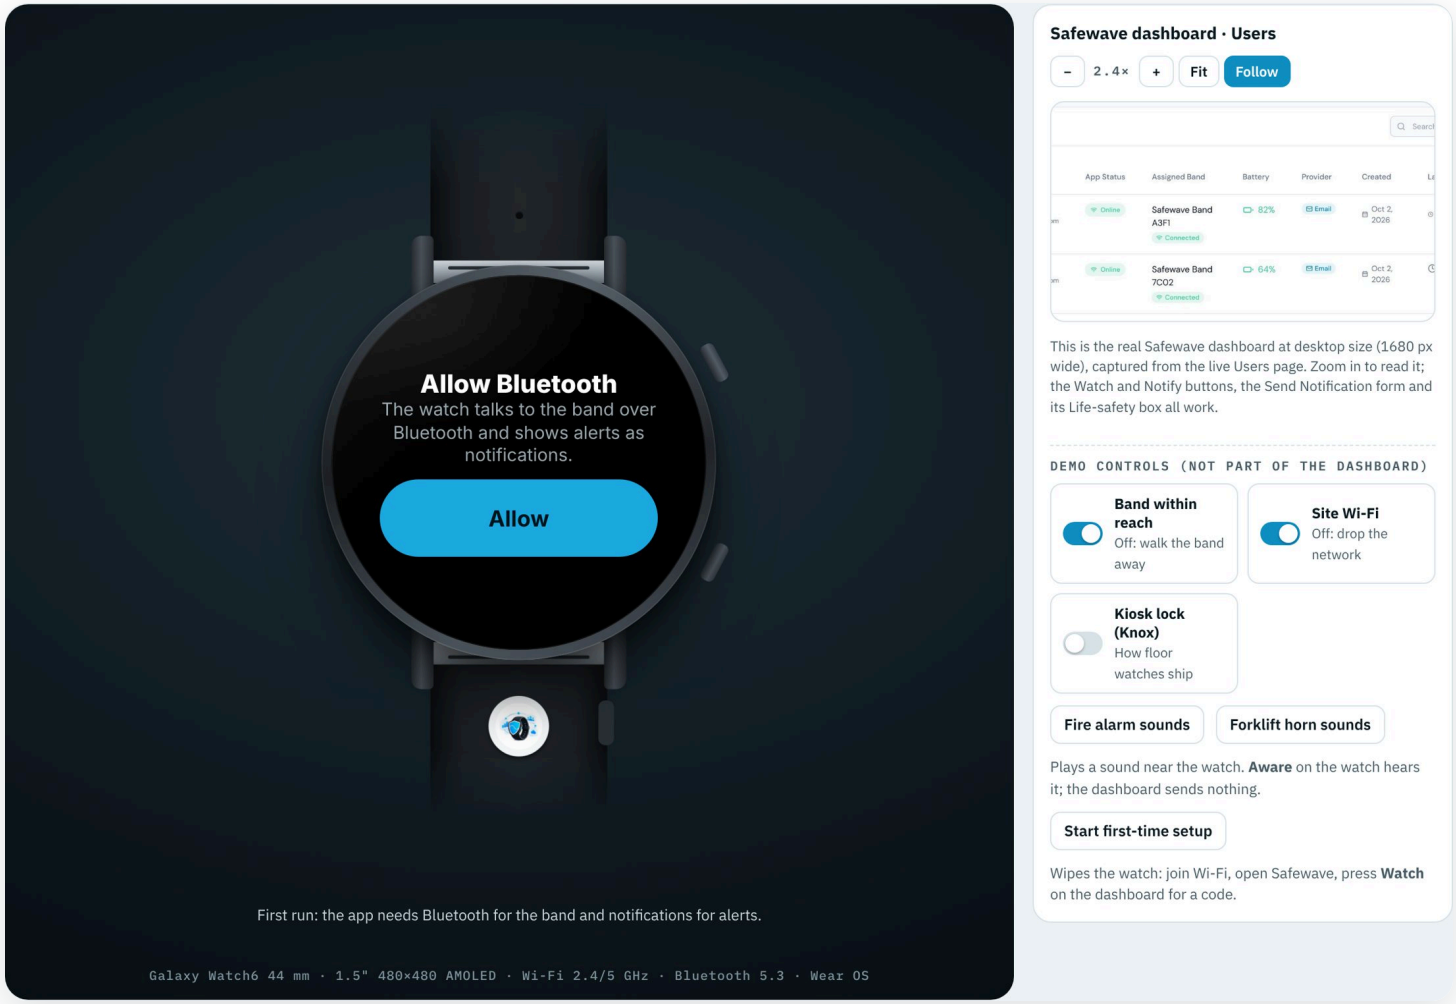

On the real dashboard's Users page, the supervisor presses Watch on the associate's row. The dashboard issues a 6-digit code: single use, good for ten minutes.

Pair a Safewave Watch: the dashboard issues a single-use code. On the watch, open Safewave and type it.

Open Safewave and type the code

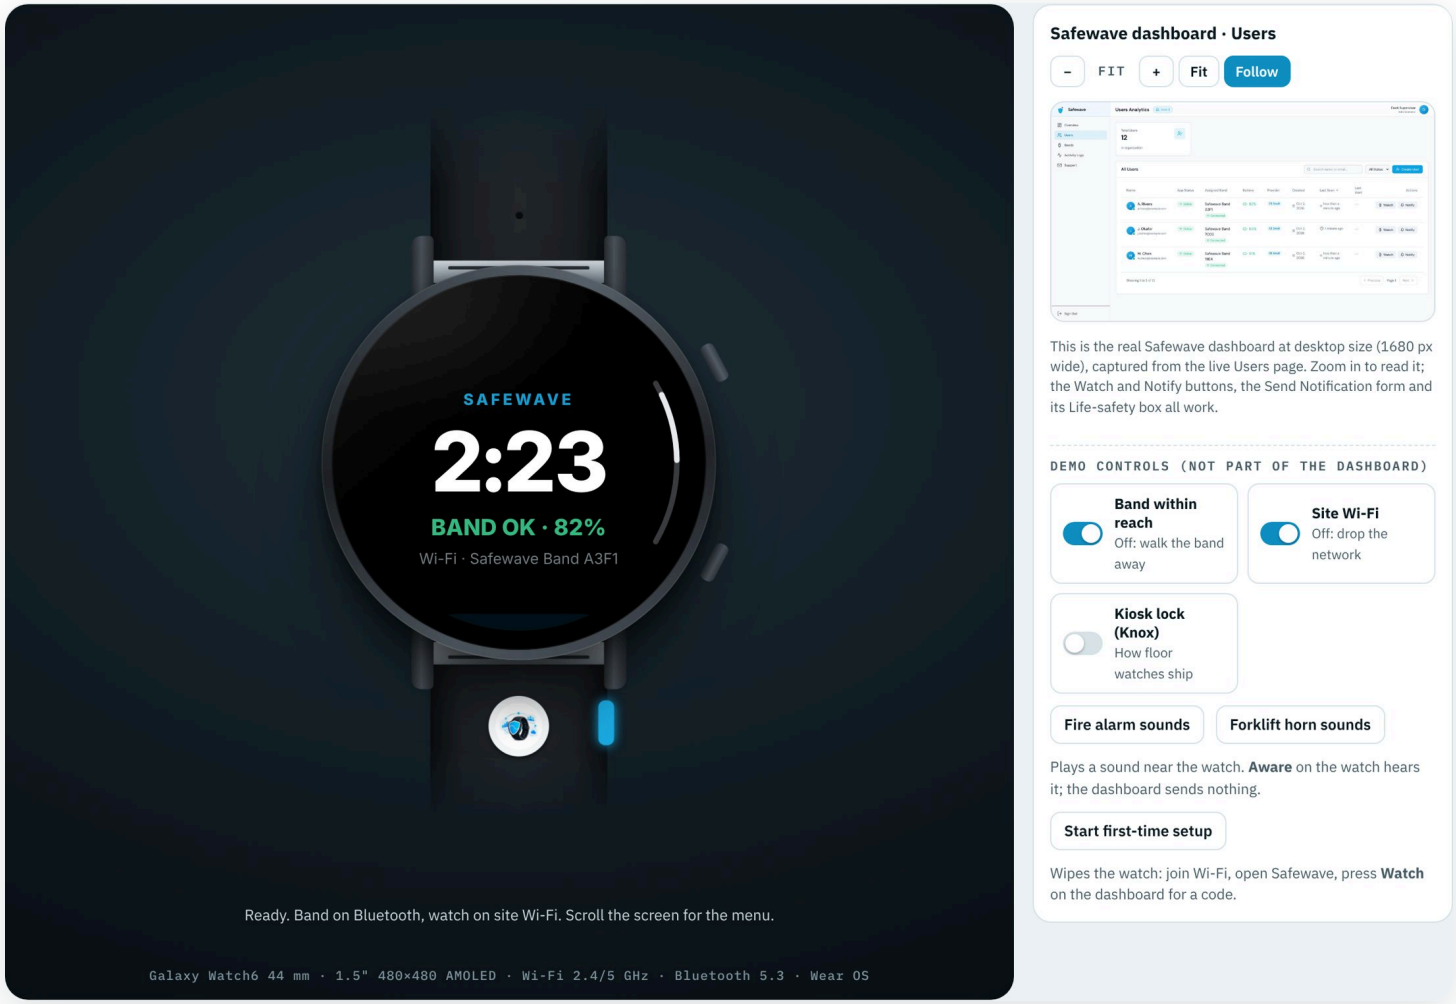

Top key for the apps, tap the blue shield. The first screen is a keypad, because nobody types an email or a password on a watch. Type the code from the dashboard.

First run: the app needs Bluetooth for the band and notifications for alerts.

Allow Bluetooth, pick the band

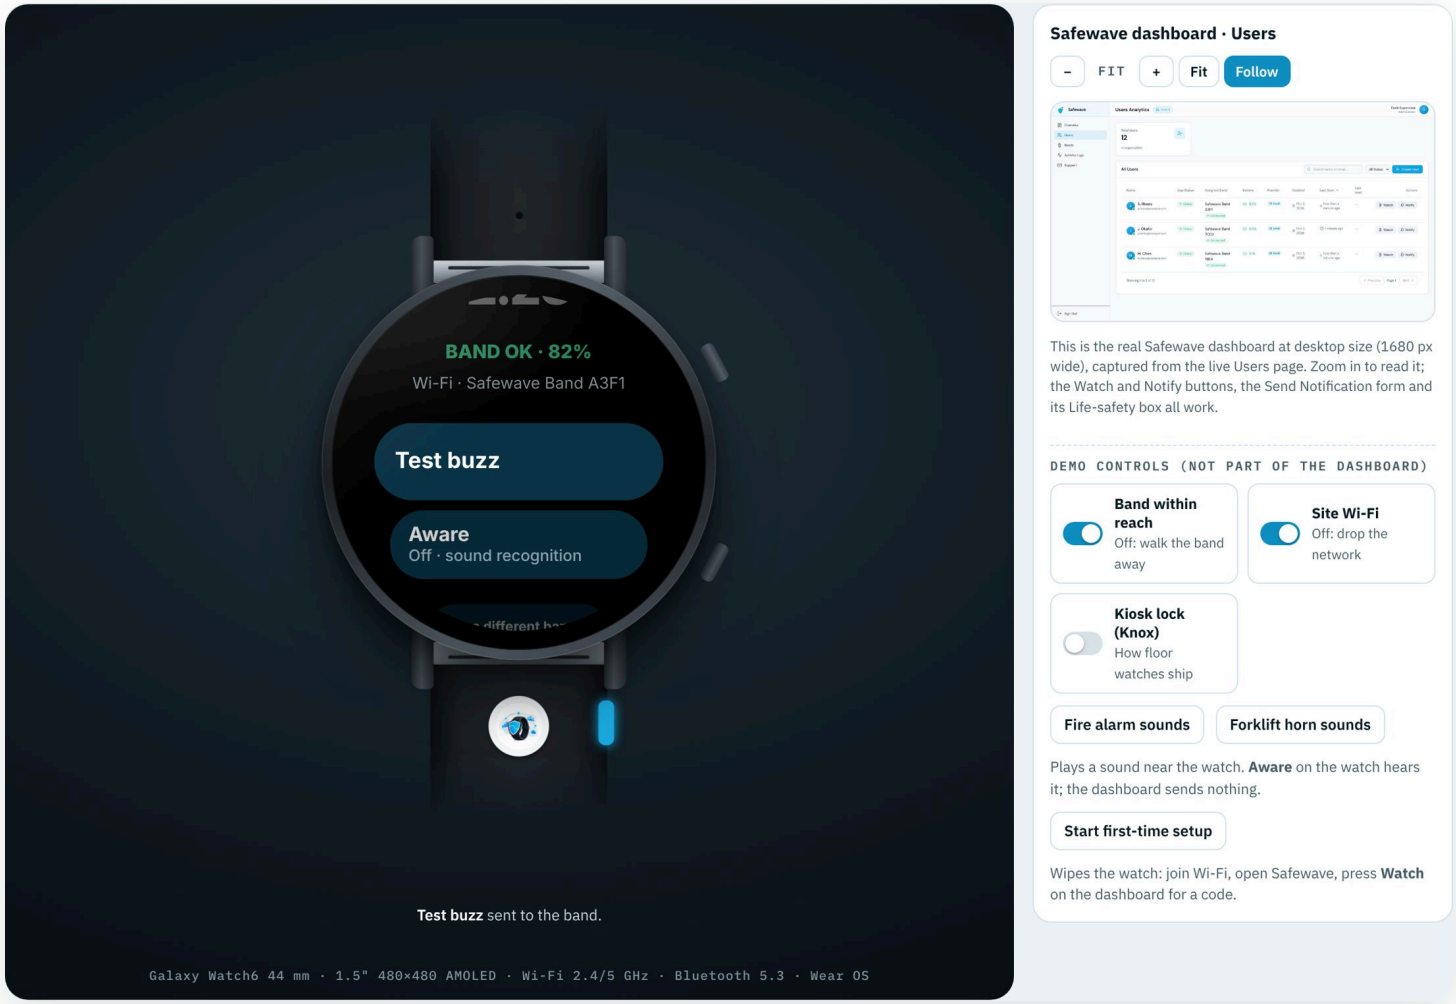

Wear OS asks once for Bluetooth and notifications. Then the watch scans and lists the Safewave bands it can hear, closest first.

Ready. Band on Bluetooth, watch on site Wi-Fi. Scroll the screen for the menu.

Ready for the shift

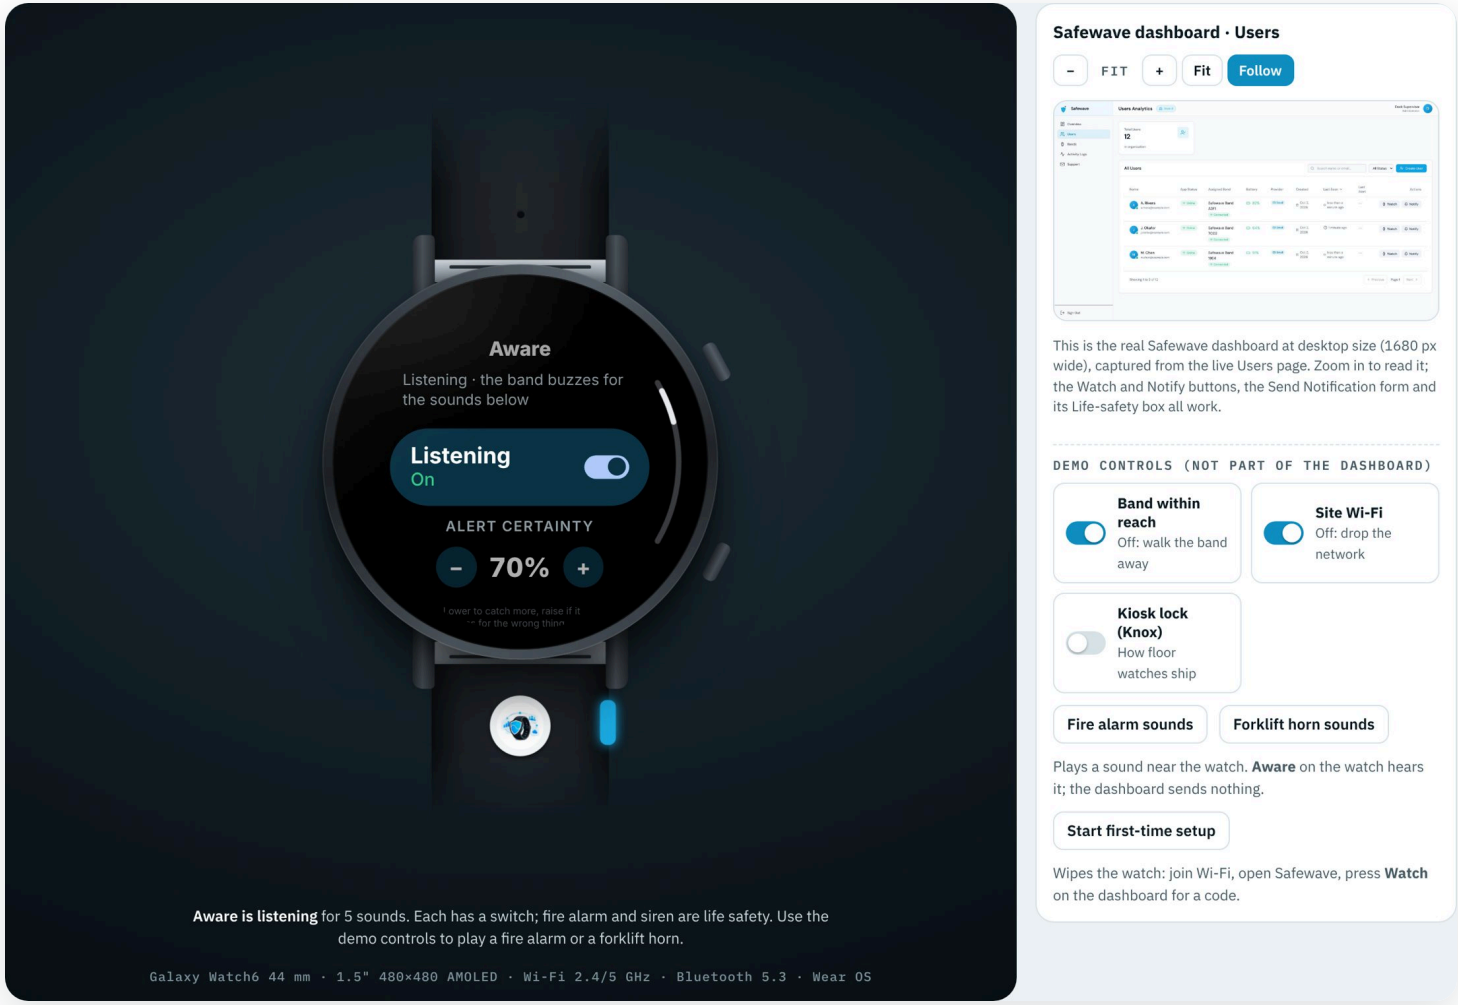

BAND OK with the band's battery, Wi-Fi on. Test buzz sends one pulse to the band so the wearer feels what an alert will be like.

Test buzz sent to the band.

Safewave Aware: the watch listens for sounds

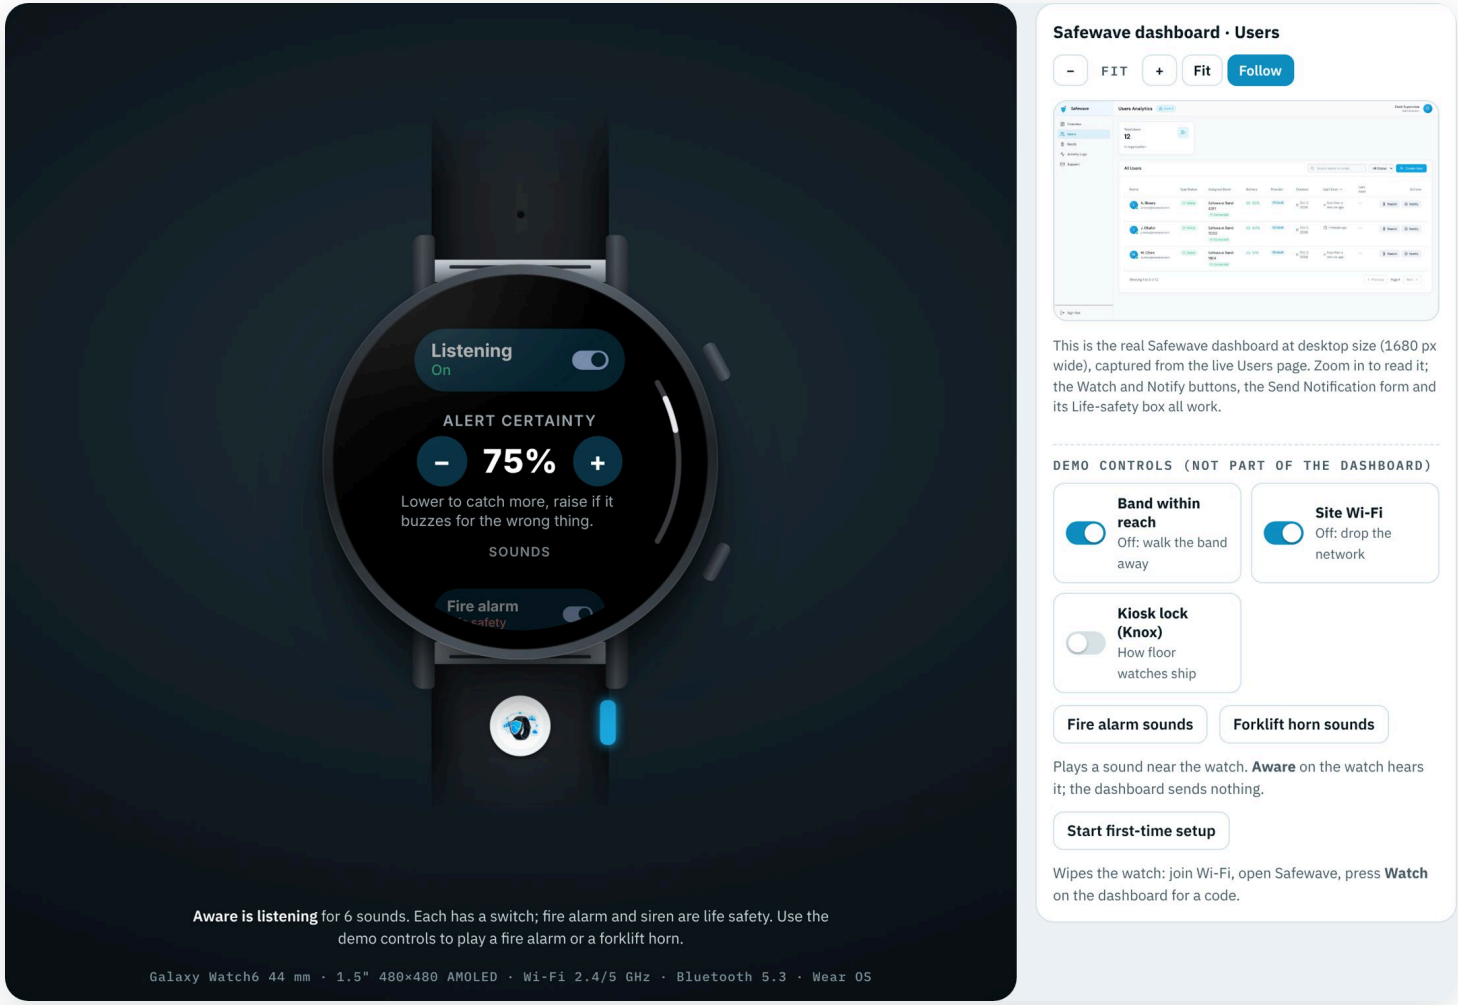

Aware is sound recognition on the watch itself. In the Safewave menu, open Aware and turn Listening on. The first time, Wear OS asks for the microphone. Recognition runs on the watch; no audio is recorded or sent anywhere.

Aware is listening for 5 sounds. Each has a switch; fire alarm and siren are life safety. Use the demo controls to play a fire alarm or a forklift horn.

Choose what it listens for

Every sound has its own switch: fire alarm, siren, alarms, vehicle horns, reversing beeps, shouting and more. Fire alarm and siren are life safety. Alert certainty is how sure Aware must be before the band buzzes: lower catches more, higher cuts false buzzes.

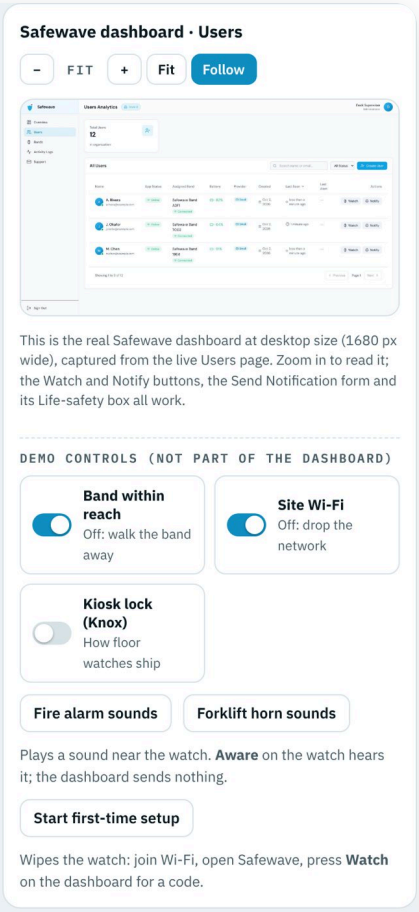

Aware is listening for 6 sounds. Each has a switch; fire alarm and siren are life safety. Use the demo controls to play a fire alarm or a forklift horn.

A fire alarm goes off

The fire alarm sounds. Aware hears it in two windows in a row above the certainty level and raises the same red life-safety alert a dashboard evacuation uses: the band buzzes at full strength until the button is pressed. The watch heard it on its own; no supervisor had to send anything.

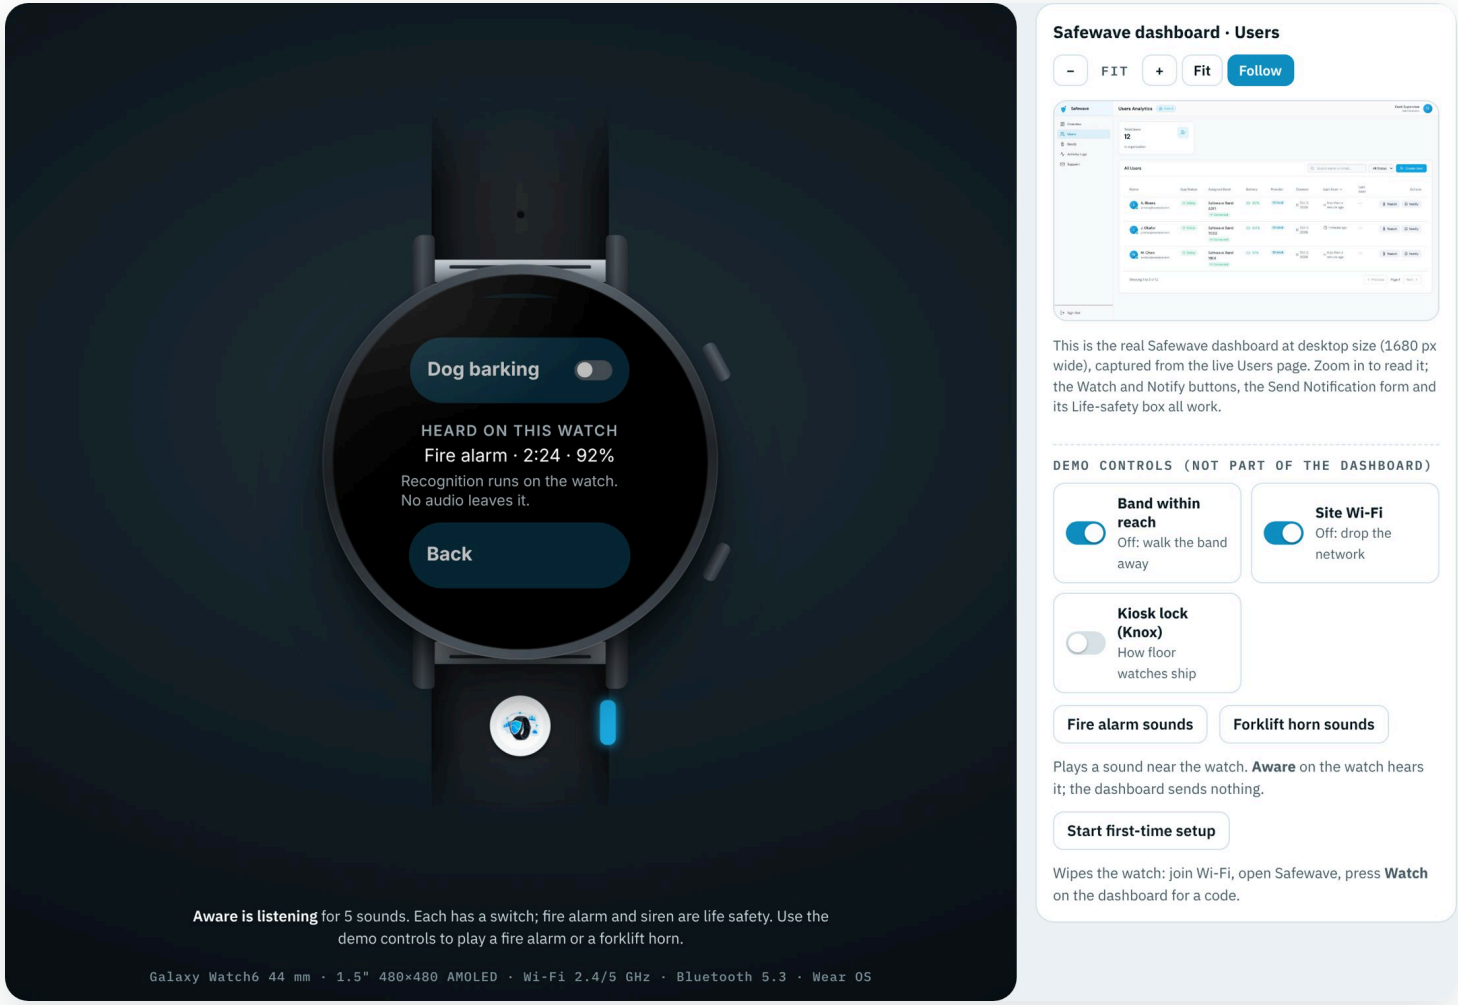

Aware heard a fire alarm on the watch's own microphone and raised a red life-safety alert. Band buzzing nonstop. Tap I'M MOVING or press the band button. The dashboard sent nothing.

Heard on this watch

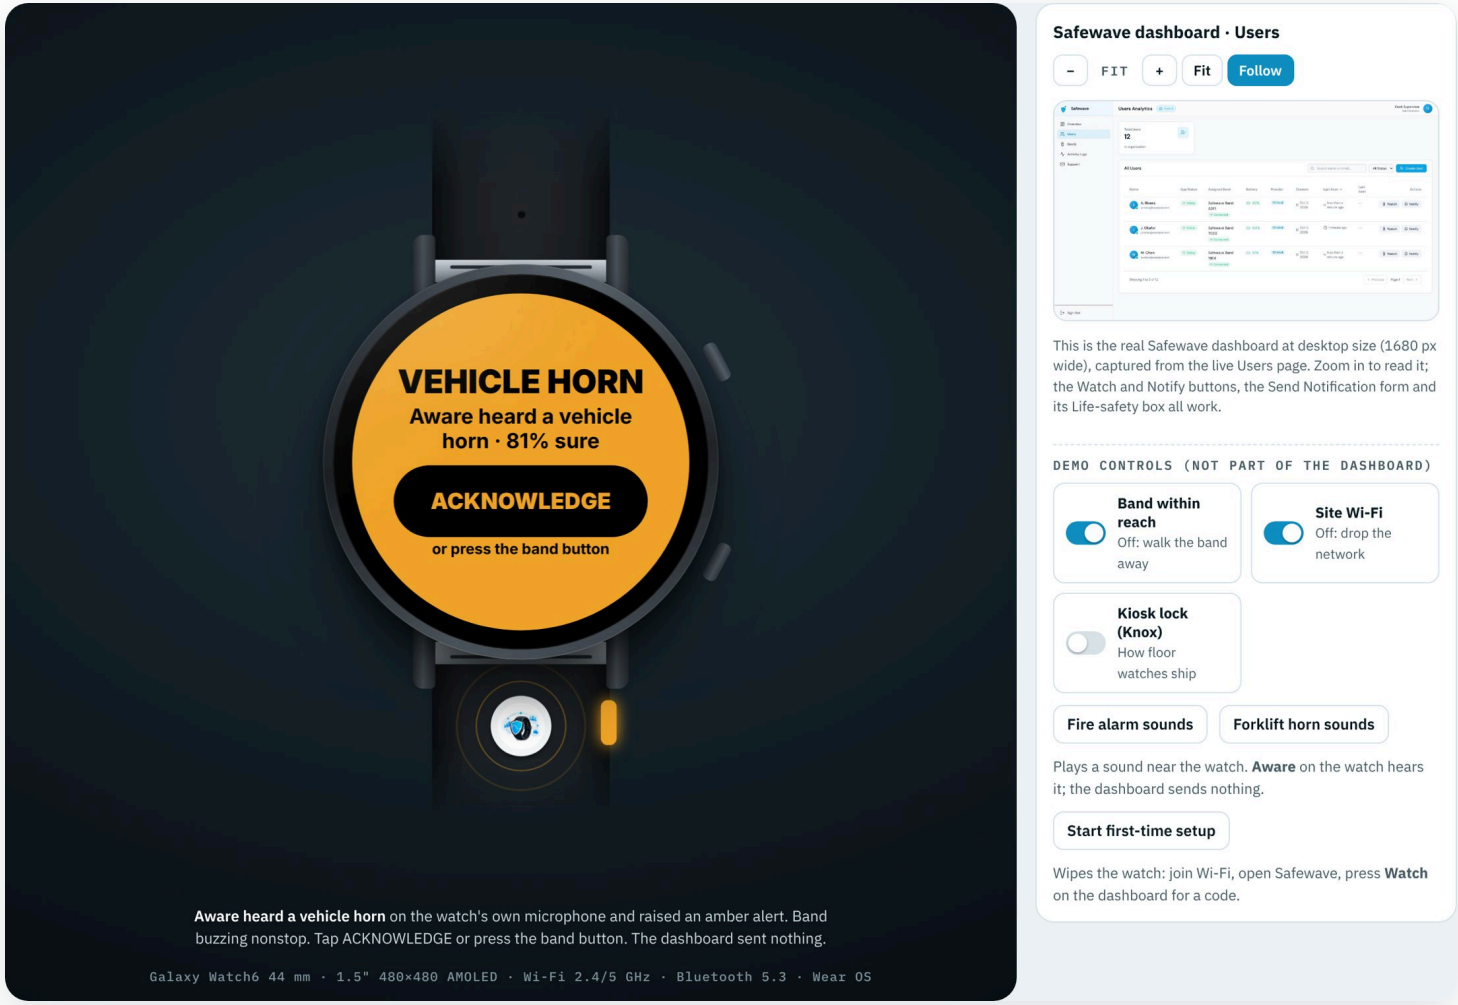

Back in Aware, the last detections are listed with the time and how sure it was. Each one is also saved to the associate's Aware history, the same record the phone app's Aware keeps. A forklift horn is an ordinary amber alert, not red.

Aware is listening for 5 sounds. Each has a switch; fire alarm and siren are life safety. Use the demo controls to play a fire alarm or a forklift horn.

Heard on this watch (continued)

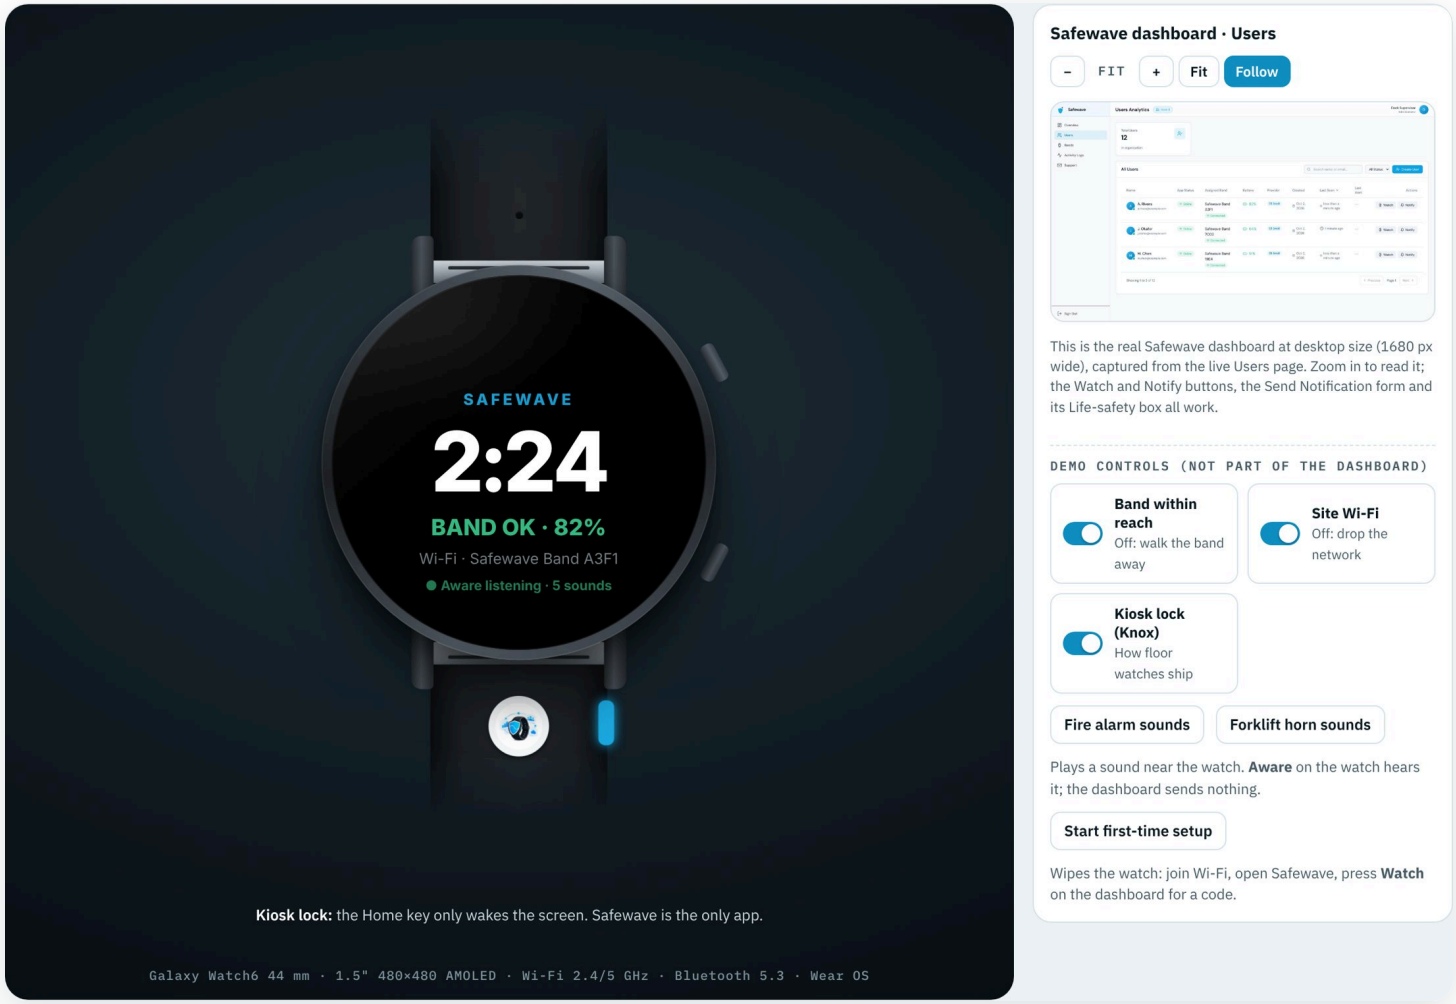

Back in Aware, the last detections are listed with the time and how sure it was. Each one is also saved to the associate's Aware history, the same record the phone app's Aware keeps. A forklift horn is an ordinary amber alert, not red.

Aware heard a vehicle horn on the watch's own microphone and raised an amber alert. Band buzzing nonstop. Tap ACKNOWLEDGE or press the band button. The dashboard sent nothing.

Kiosk lock: how floor watches ship

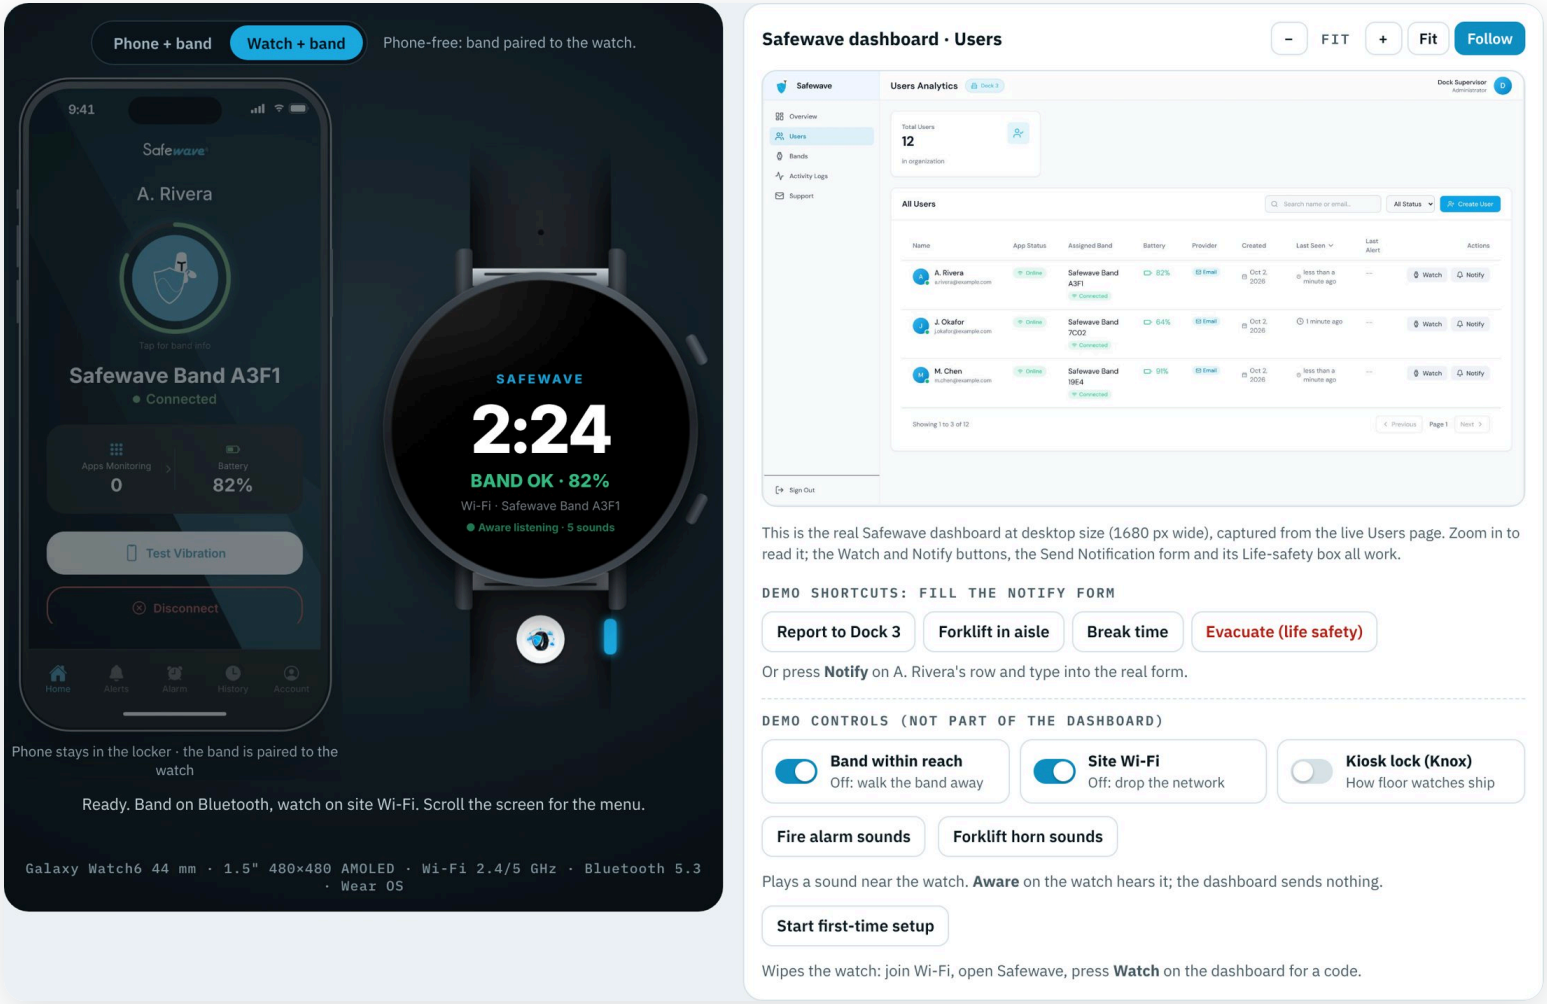

With Samsung Knox the watch is locked to Safewave. No watch face, no other apps; the keys only wake the screen. Setup happens in the office, then the watch runs alone on the floor.

Kiosk lock: the Home key only wakes the screen. Safewave is the only app.

The whole system, side by side

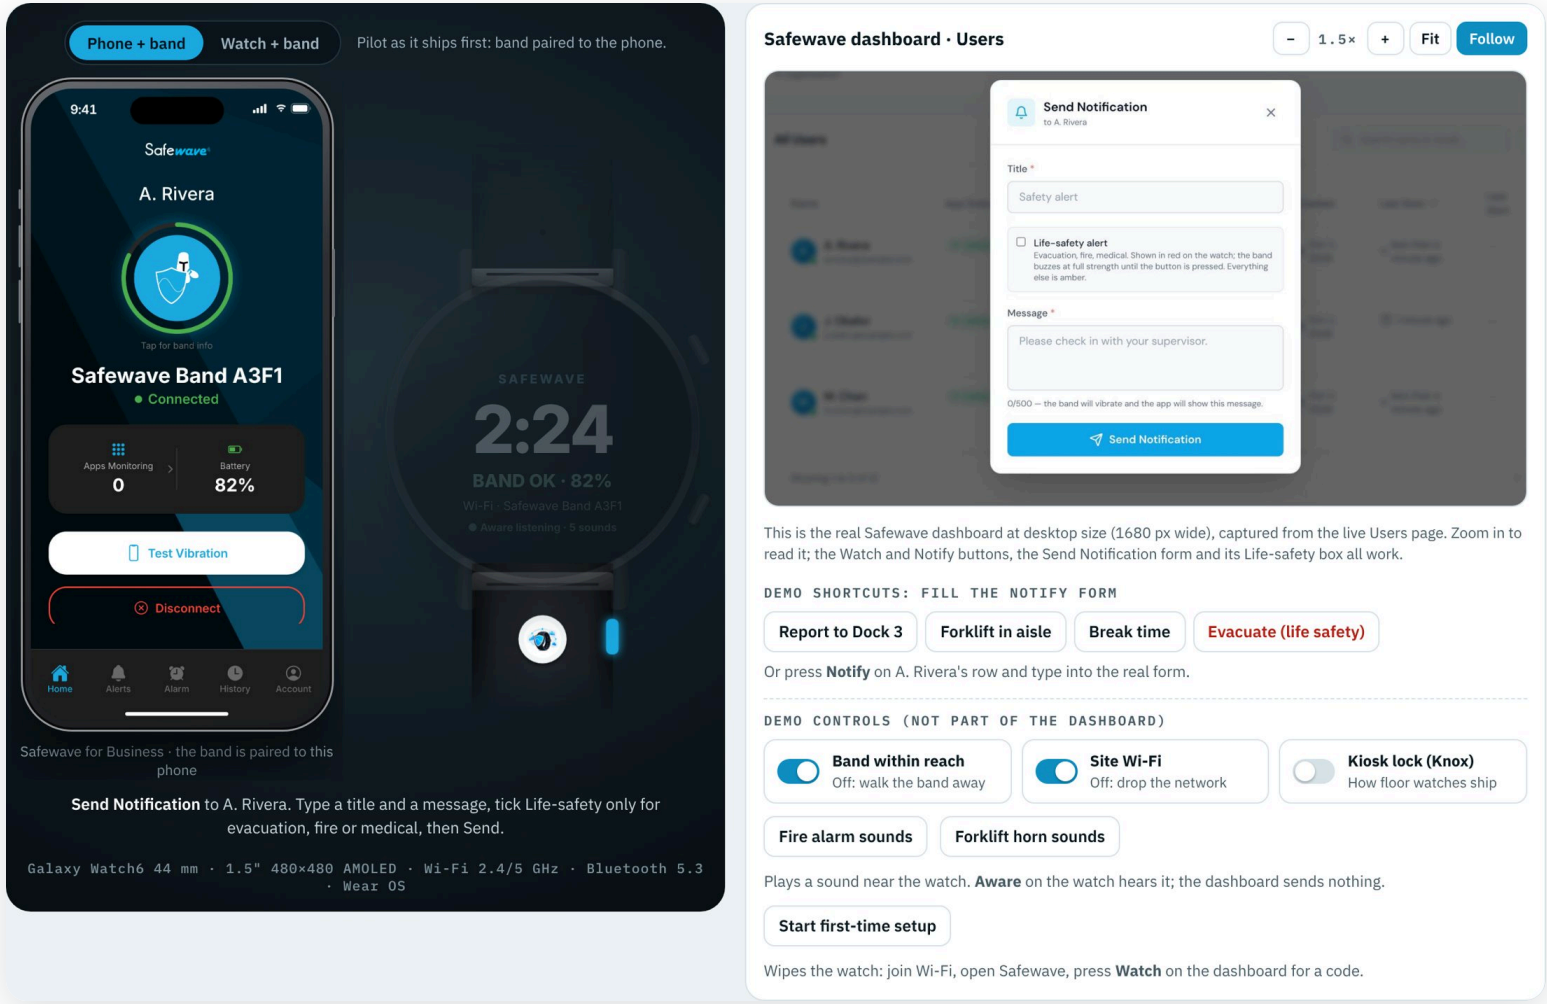

The real Safewave dashboard at desktop size, the Safewave for Business app on a phone, and the watch. One band, one account, one cloud. Zoom the dashboard with the buttons or drag it; the switch above the devices sets which device the band is paired to.

Ready. Band on Bluetooth, watch on site Wi-Fi. Scroll the screen for the menu.

Phone + band: the supervisor presses Notify

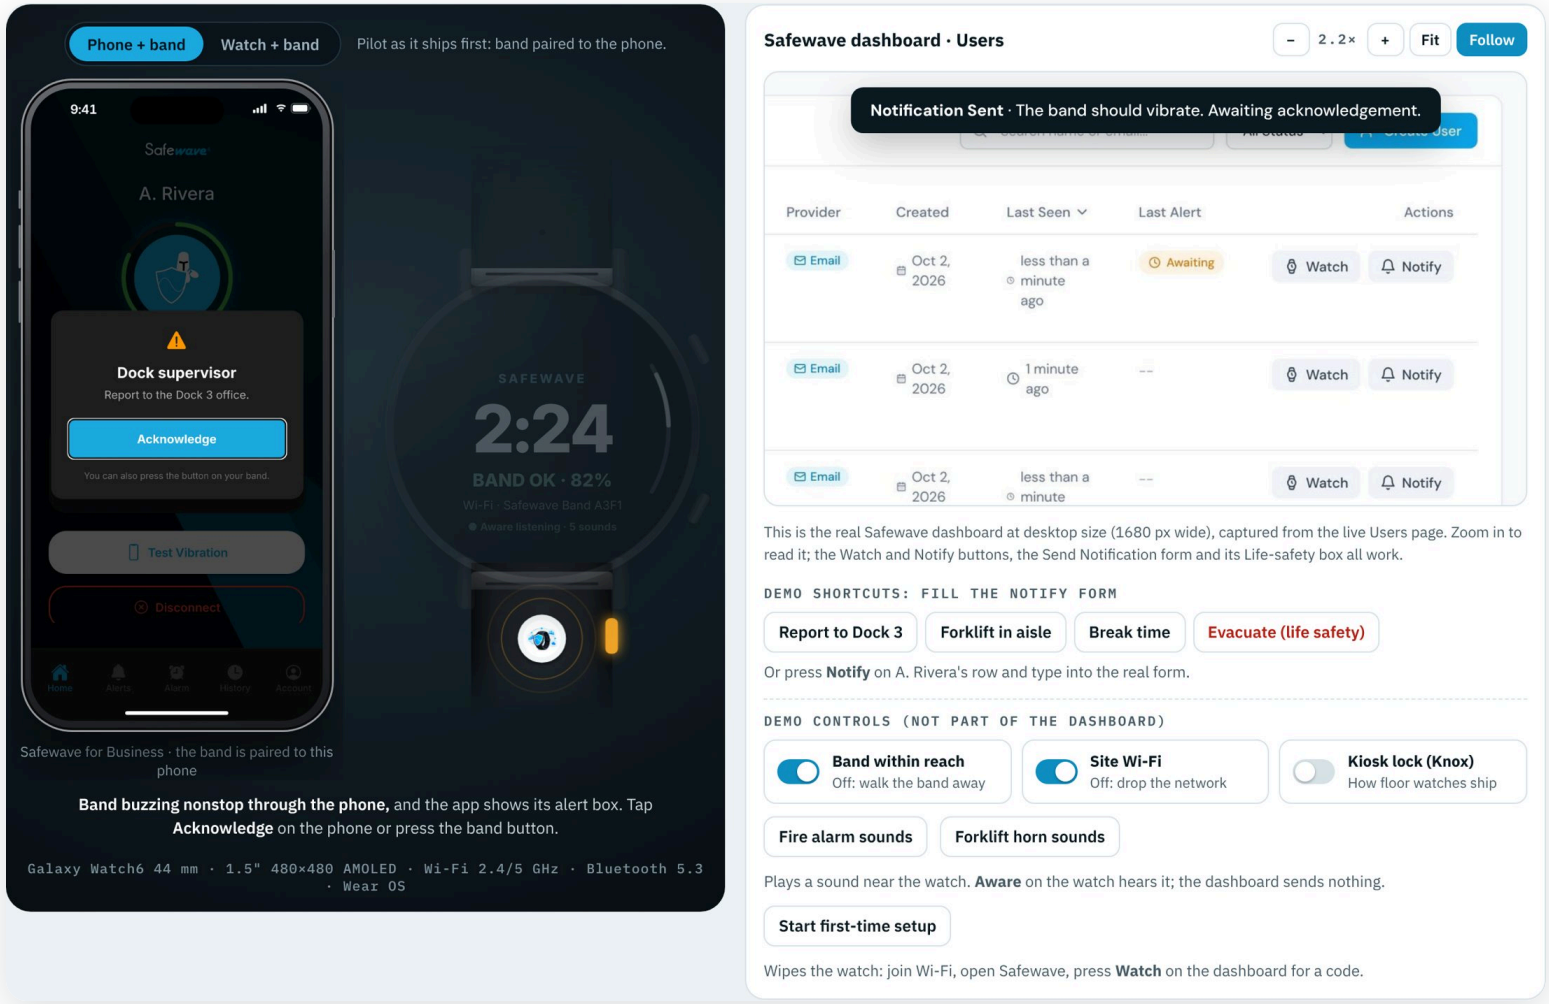

How the Amazon pilot ships first: the band is paired to the phone in the associate's pocket. On the Users page the supervisor finds the associate and presses Notify. The Send Notification form opens.

Send Notification to A. Rivera. Type a title and a message, tick Life-safety only for evacuation, fire or medical, then Send.

Write the alert and send it

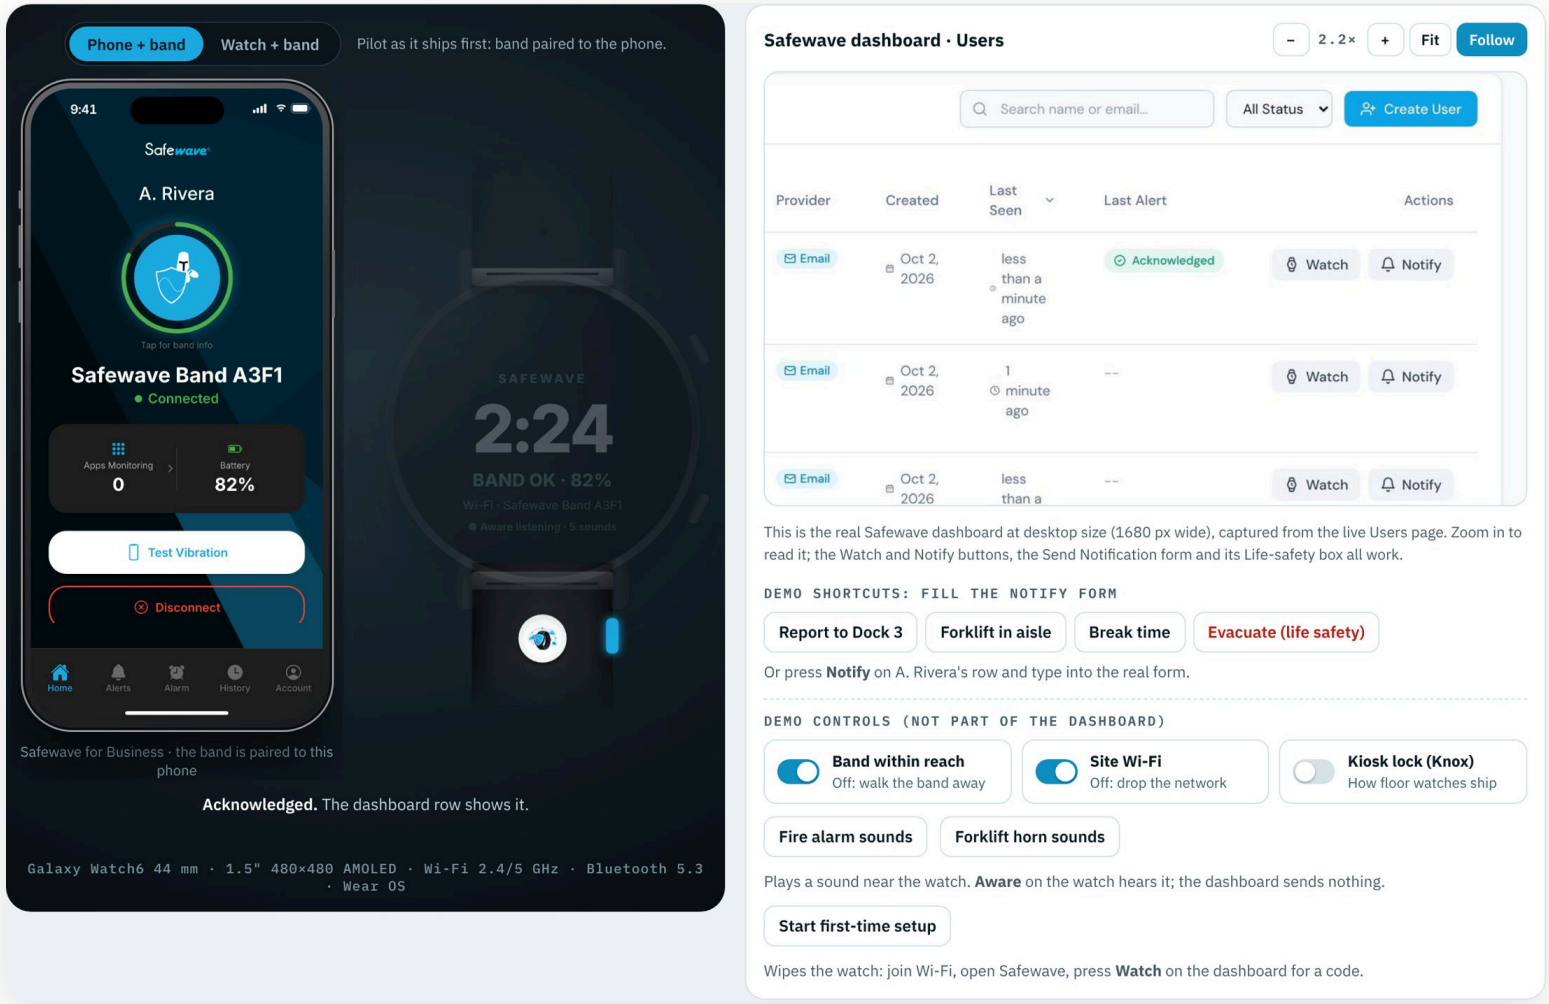

A title and a message, typed into the real form. Send Notification is enabled once both are filled. The dashboard confirms Notification Sent and the row shows Awaiting.

Band buzzing nonstop through the phone, and the app shows its alert box. Tap Acknowledge on the phone or press the band button.

The phone shows it; the band buzzes

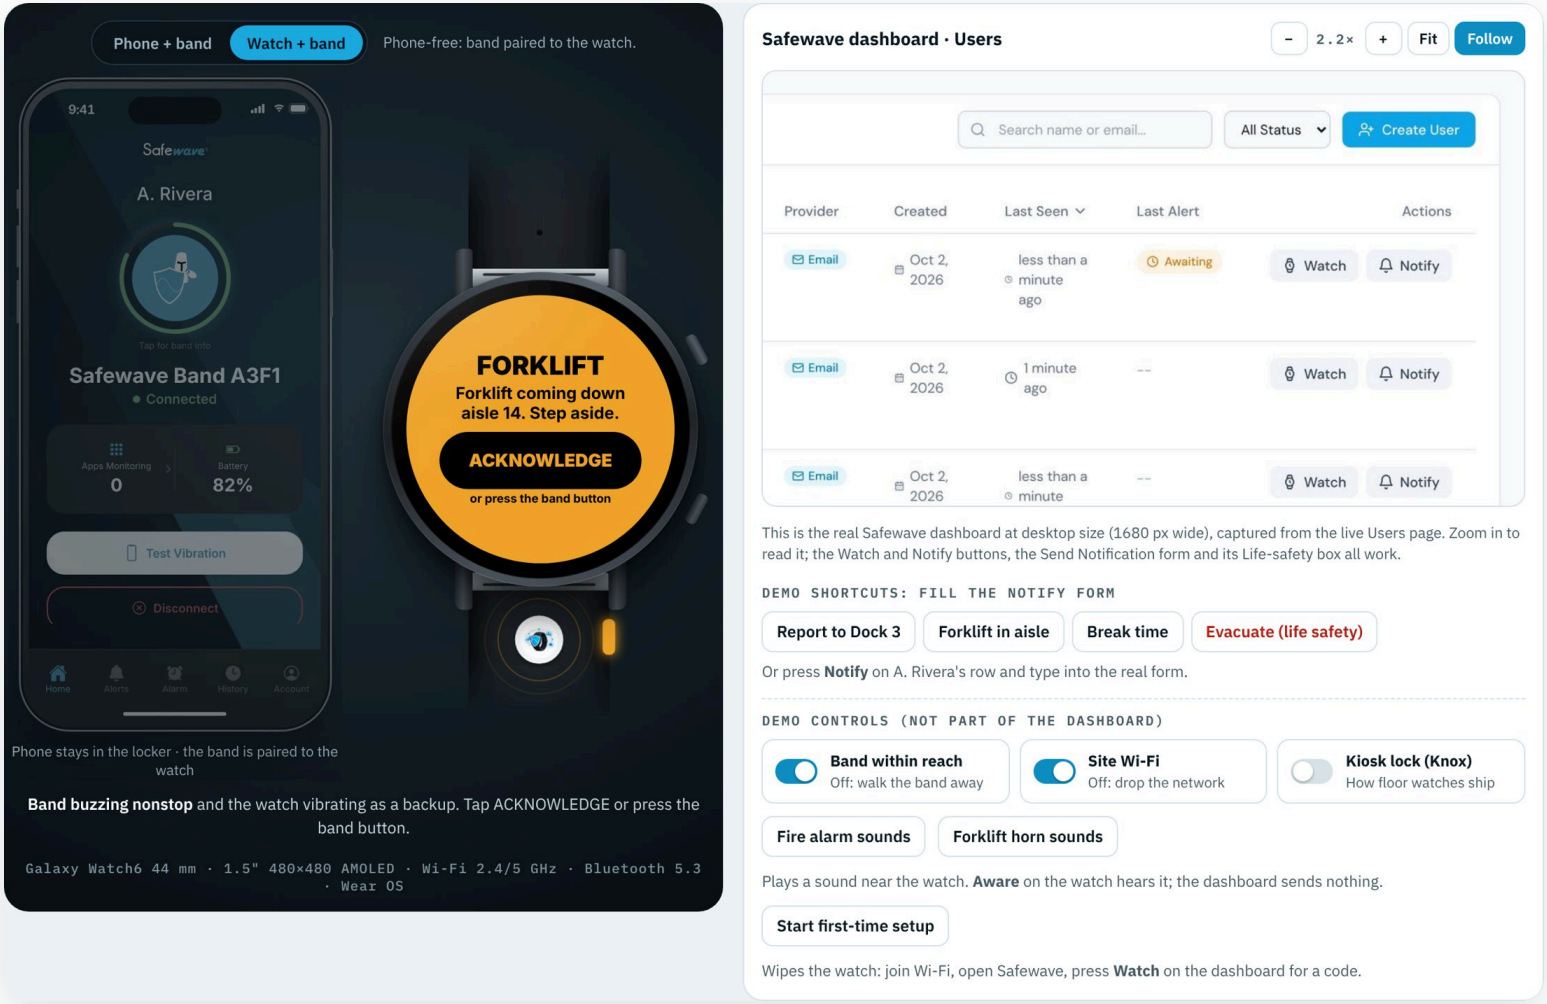

The band buzzes nonstop through the phone, and Safewave for Business opens its alert box over whatever the wearer was doing. It can't be swiped away: Acknowledge, or press the band's button.

Acknowledged. The dashboard row shows it.

Watch + band: no phones on the Amazon floor

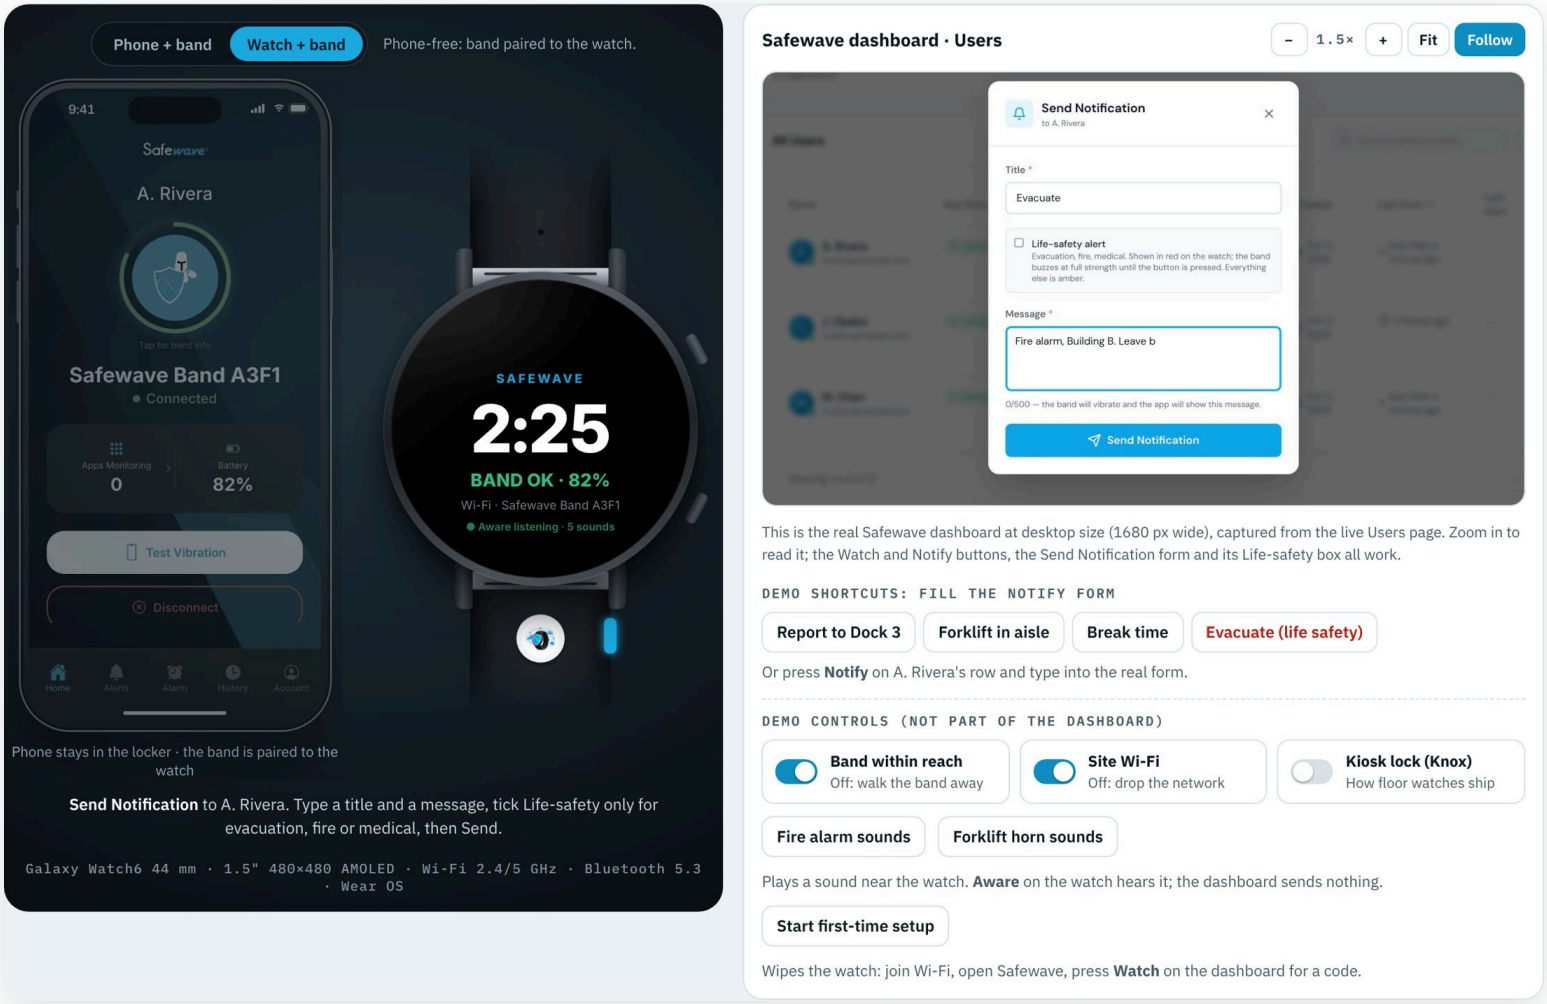

Switch the band to the watch and the phone stays in the locker, as Amazon's floor rules require. The same Notify flow on the dashboard; the alert lands on the wrist and the band buzzes exactly the same way. The band button acknowledges.

Band buzzing nonstop and the watch vibrating as a backup. Tap ACKNOWLEDGE or press the band button.

A life-safety alert

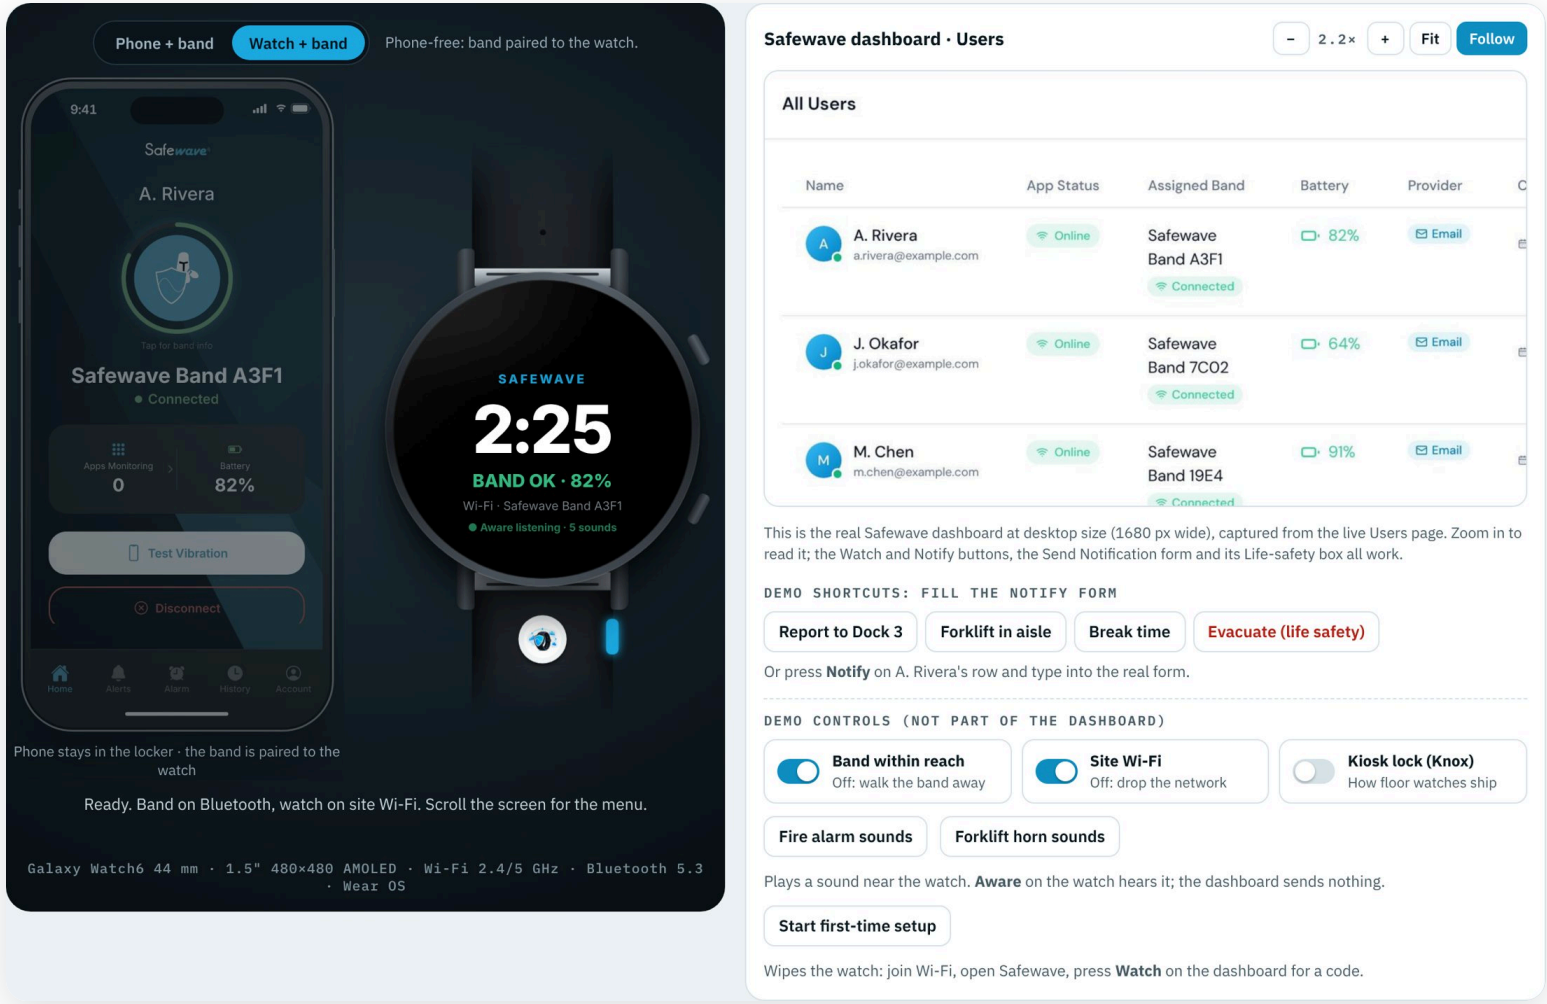

Tick Life-safety alert on the form: evacuation, fire or medical only. The watch goes red, the button says I'M MOVING, and the band buzzes at full strength until the button is pressed.

Send Notification to A. Rivera. Type a title and a message, tick Life-safety only for evacuation, fire or medical, then Send.

The band walks away

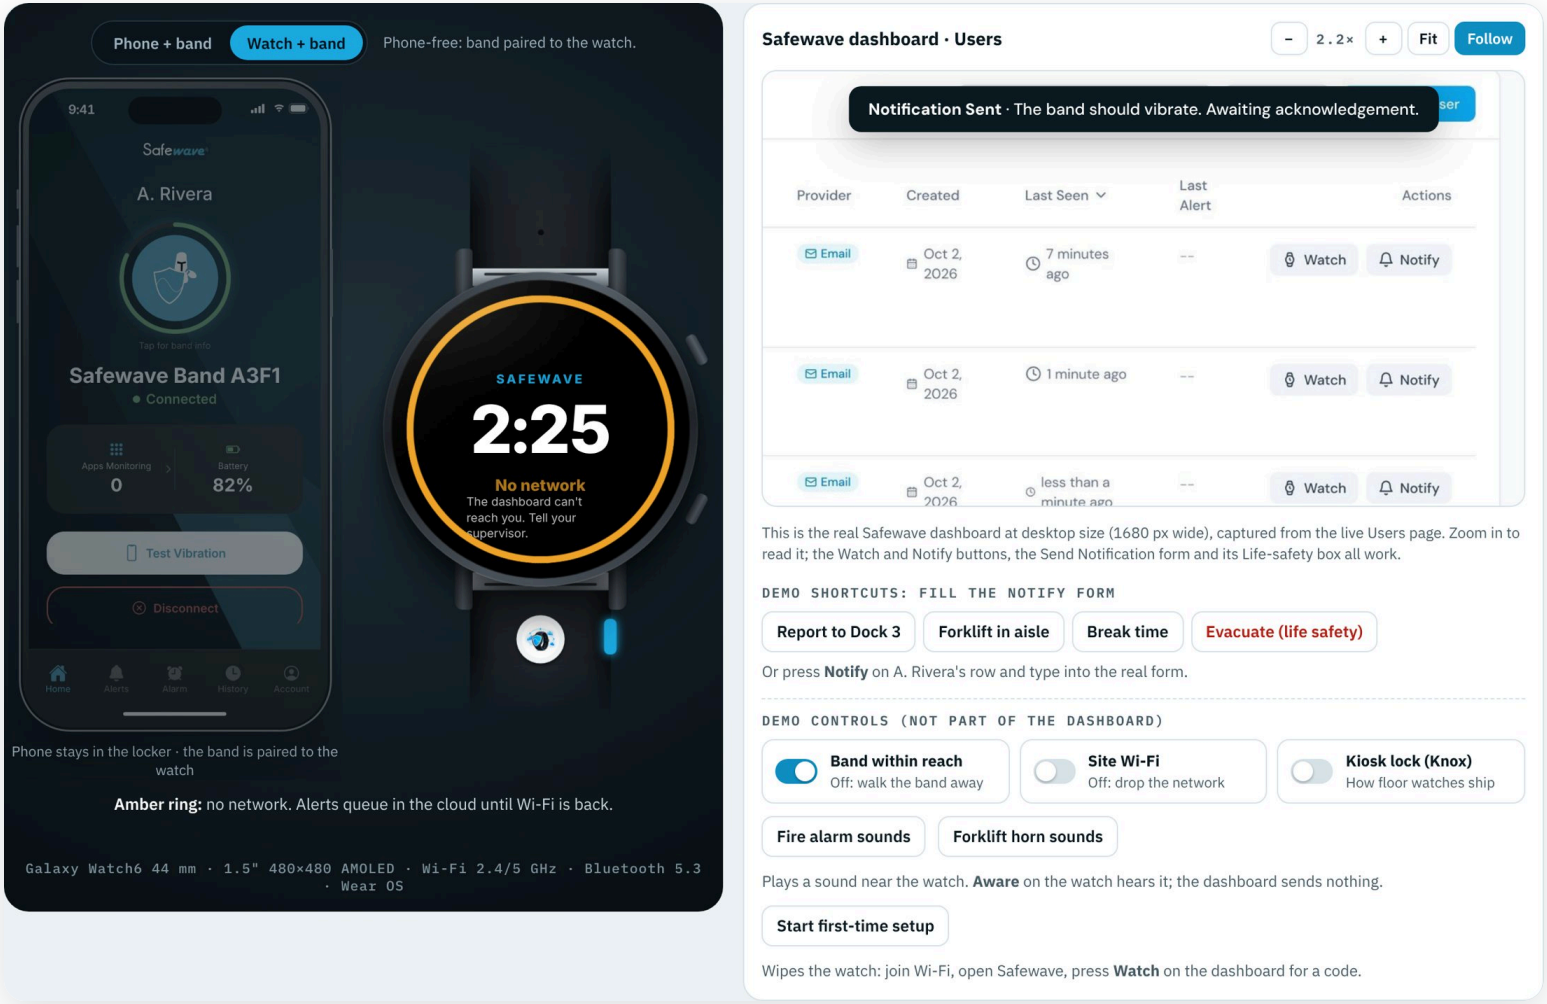

Out of Bluetooth range or flat, the watch turns its ring amber with a plain message, and the dashboard's Assigned Band column shows Not Connected for that associate. Bring it back and it reconnects on its own.

Ready. Band on Bluetooth, watch on site Wi-Fi. Scroll the screen for the menu.

Wi-Fi drops, then comes back

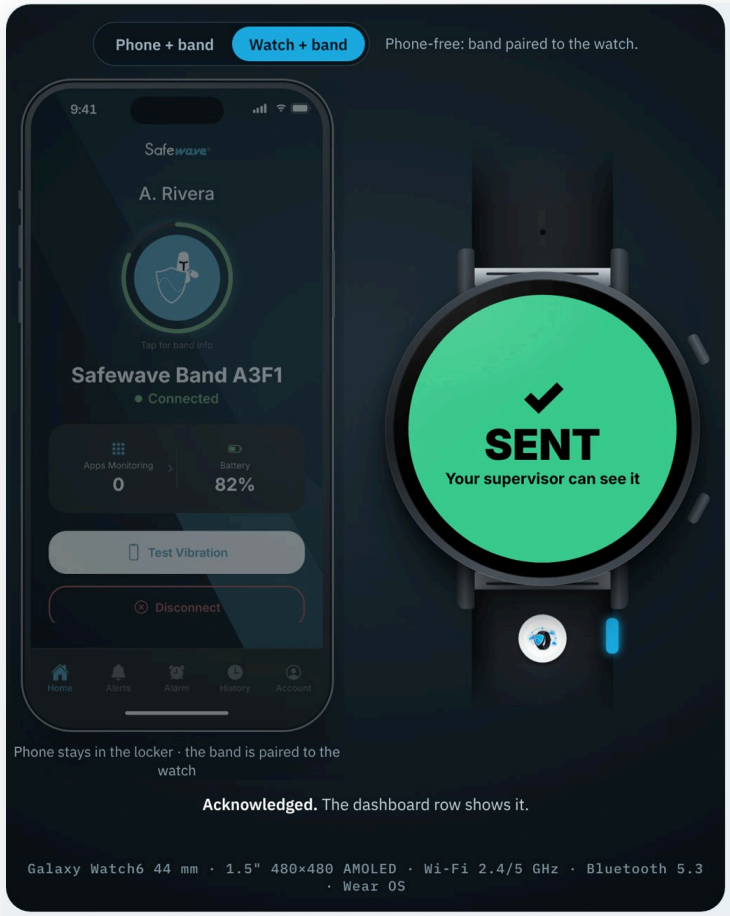

With no network the watch says so, and the dashboard's App Status turns Offline once the heartbeat stops. An alert sent now waits in the cloud, then lands the moment the watch is back on Wi-Fi.

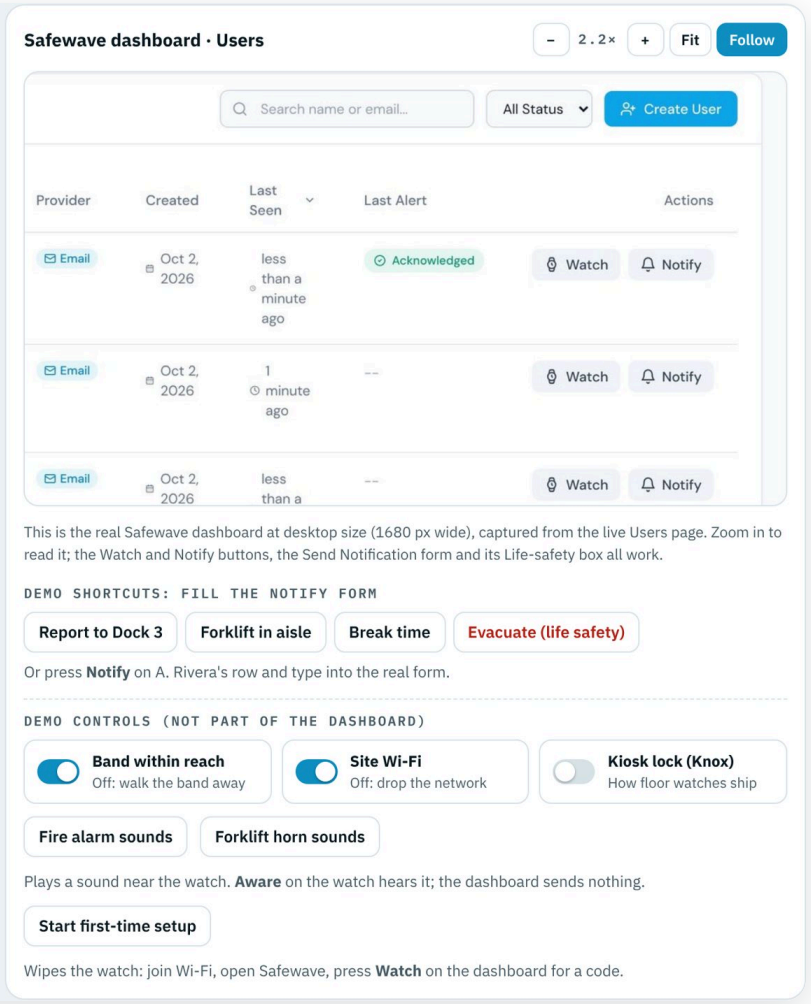

Amber ring: no network. Alerts queue in the cloud until Wi-Fi is back.

An alert wakes a dark watch

The associate is looking at the watch face, or the screen has gone dark. The supervisor sends, and the watch switches straight to the alert on its own. Nothing to open.

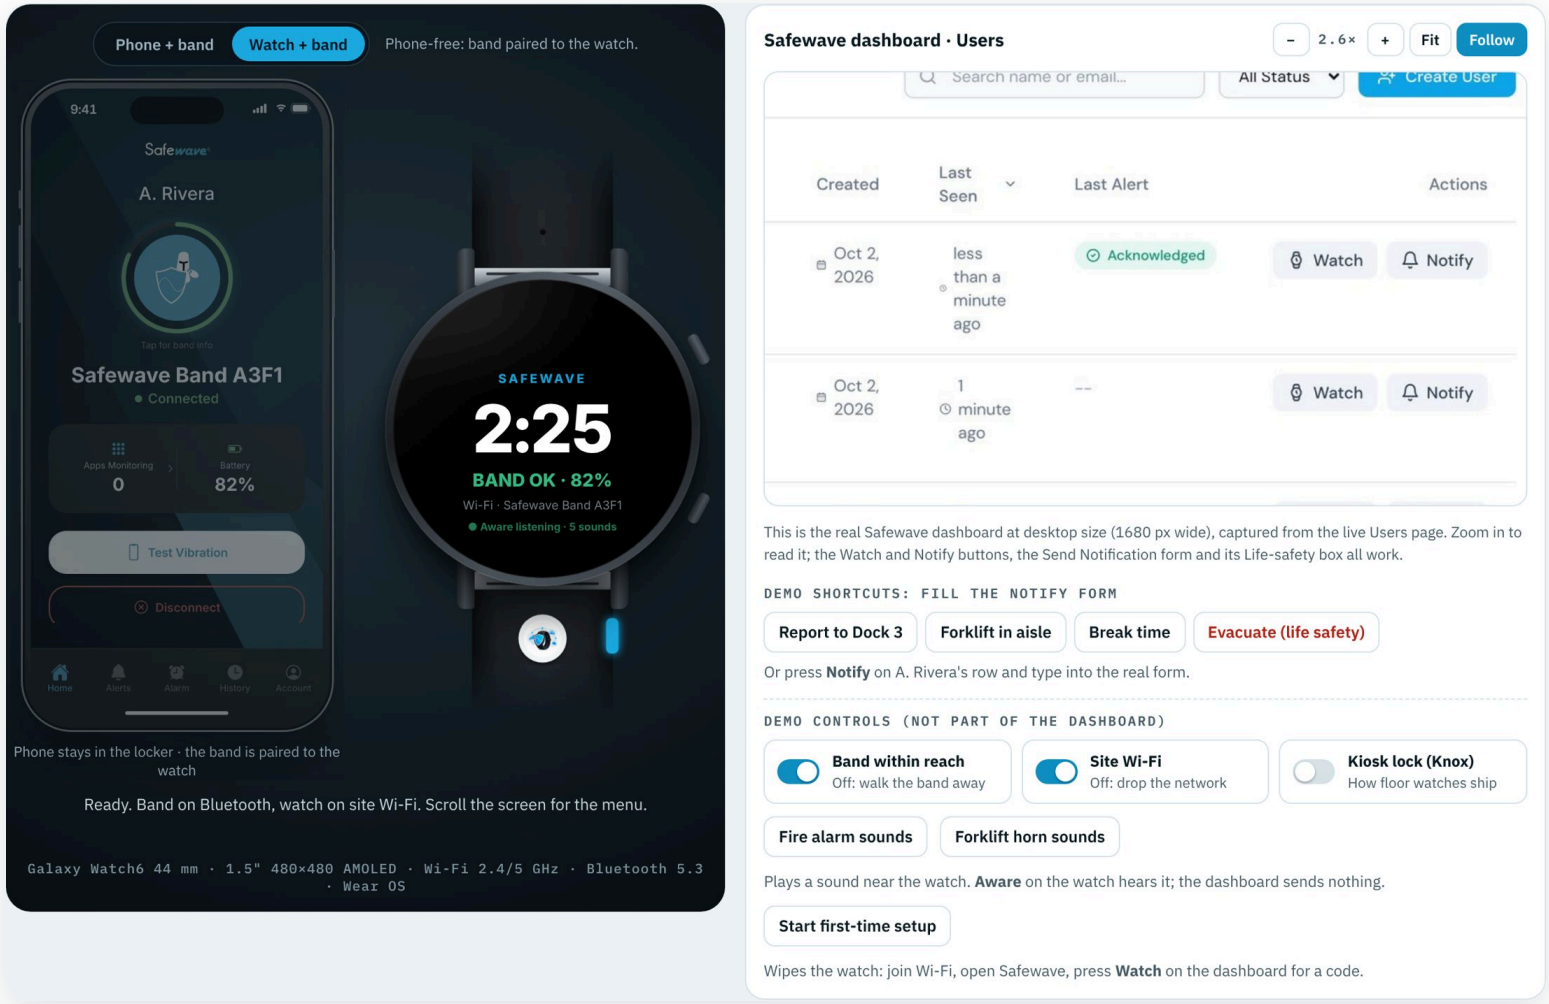

Acknowledged. The dashboard row shows it.

Acknowledged on the dashboard

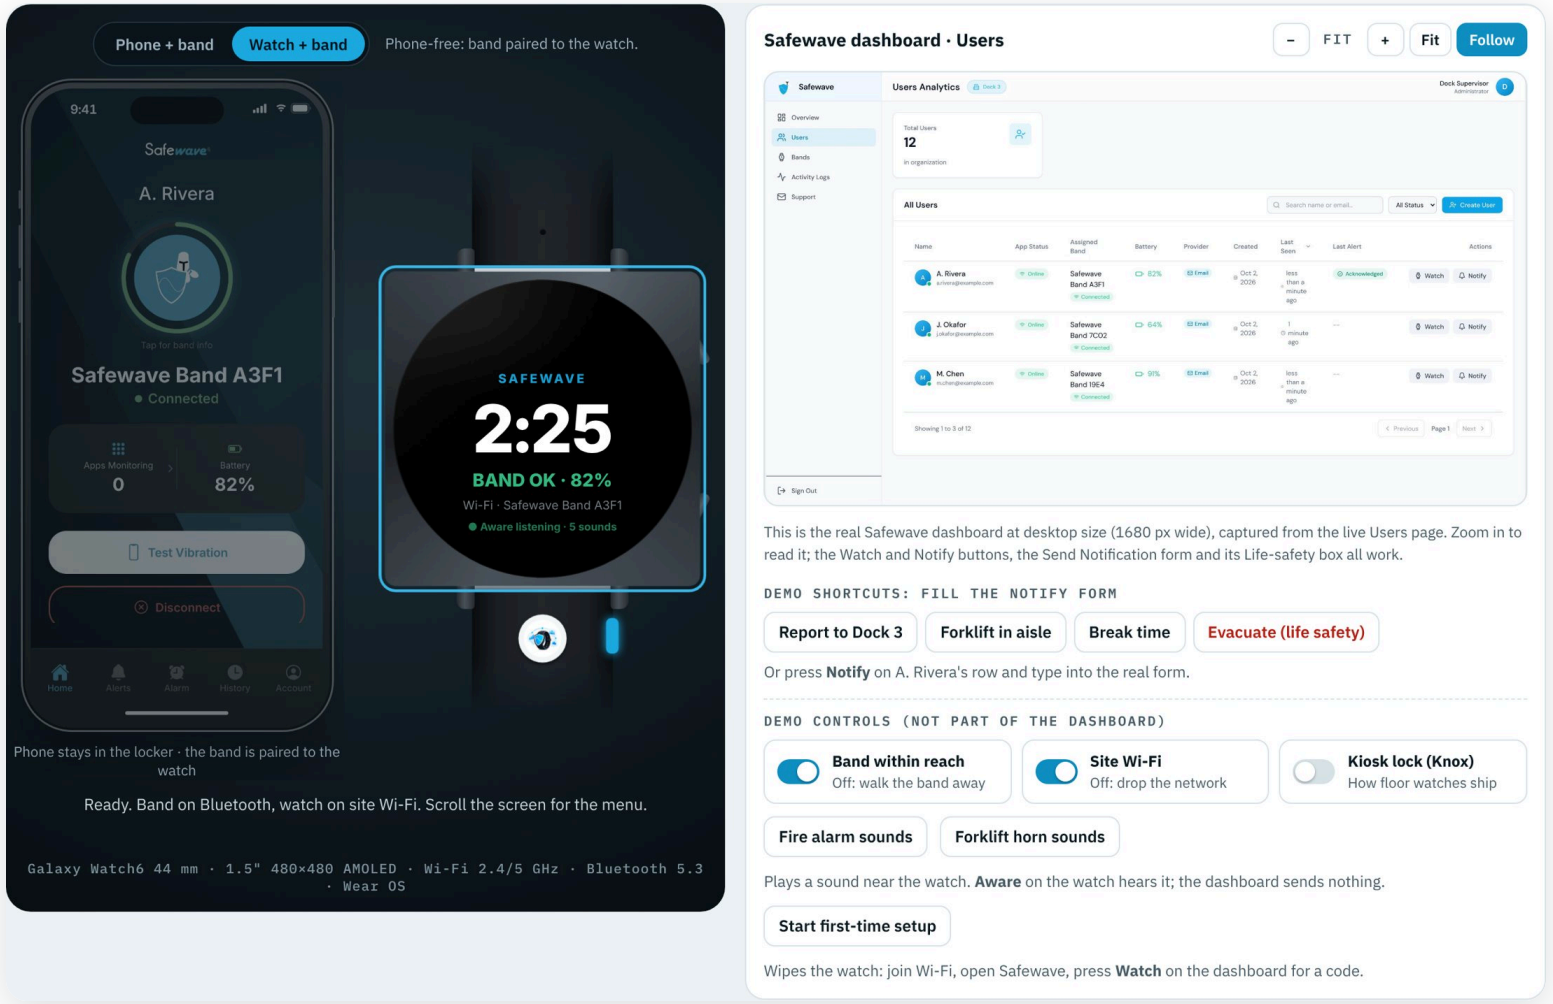

Every acknowledgement lands in the Last Alert column, with the time. That column is the supervisor's proof that the message reached the wrist.

Ready. Band on Bluetooth, watch on site Wi-Fi. Scroll the screen for the menu.

That's the whole loop

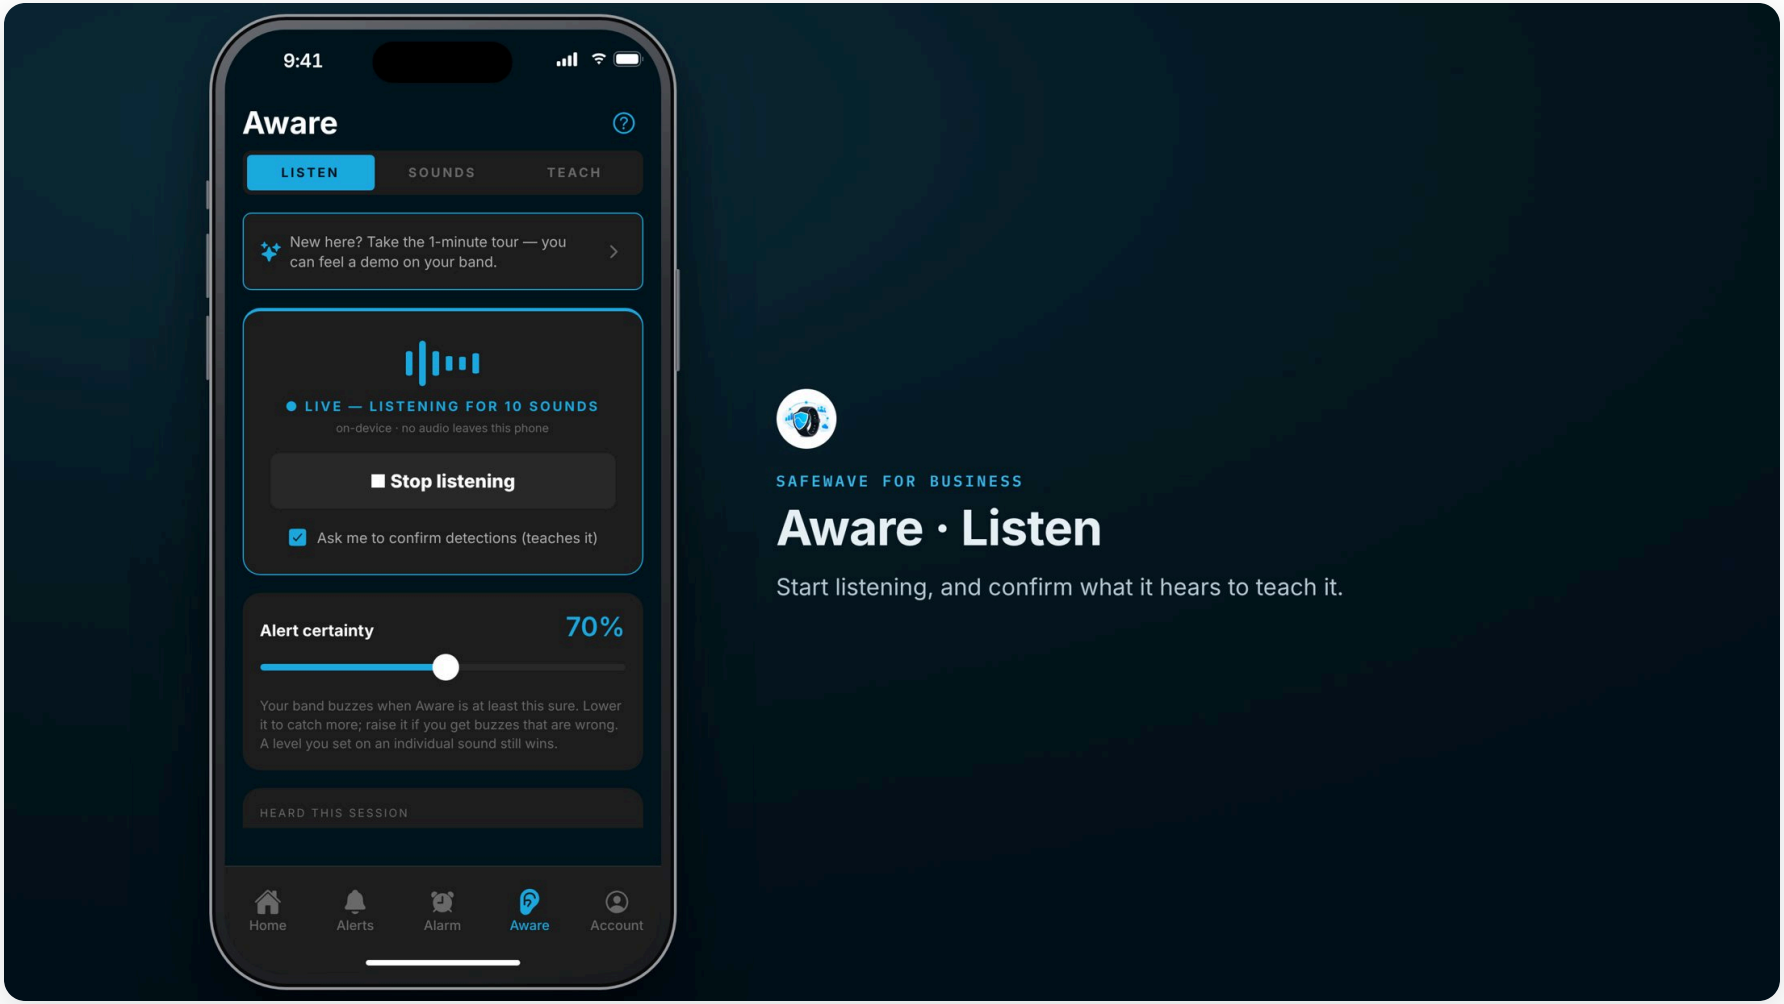

Dashboard to cloud to device to band, and the acknowledgement back. Try it yourself: press the dashboard's buttons, switch modes, flip the demo controls. Exit the demo to keep playing.

Ready. Band on Bluetooth, watch on site Wi-Fi. Scroll the screen for the menu.

Aware on the phone: start listening

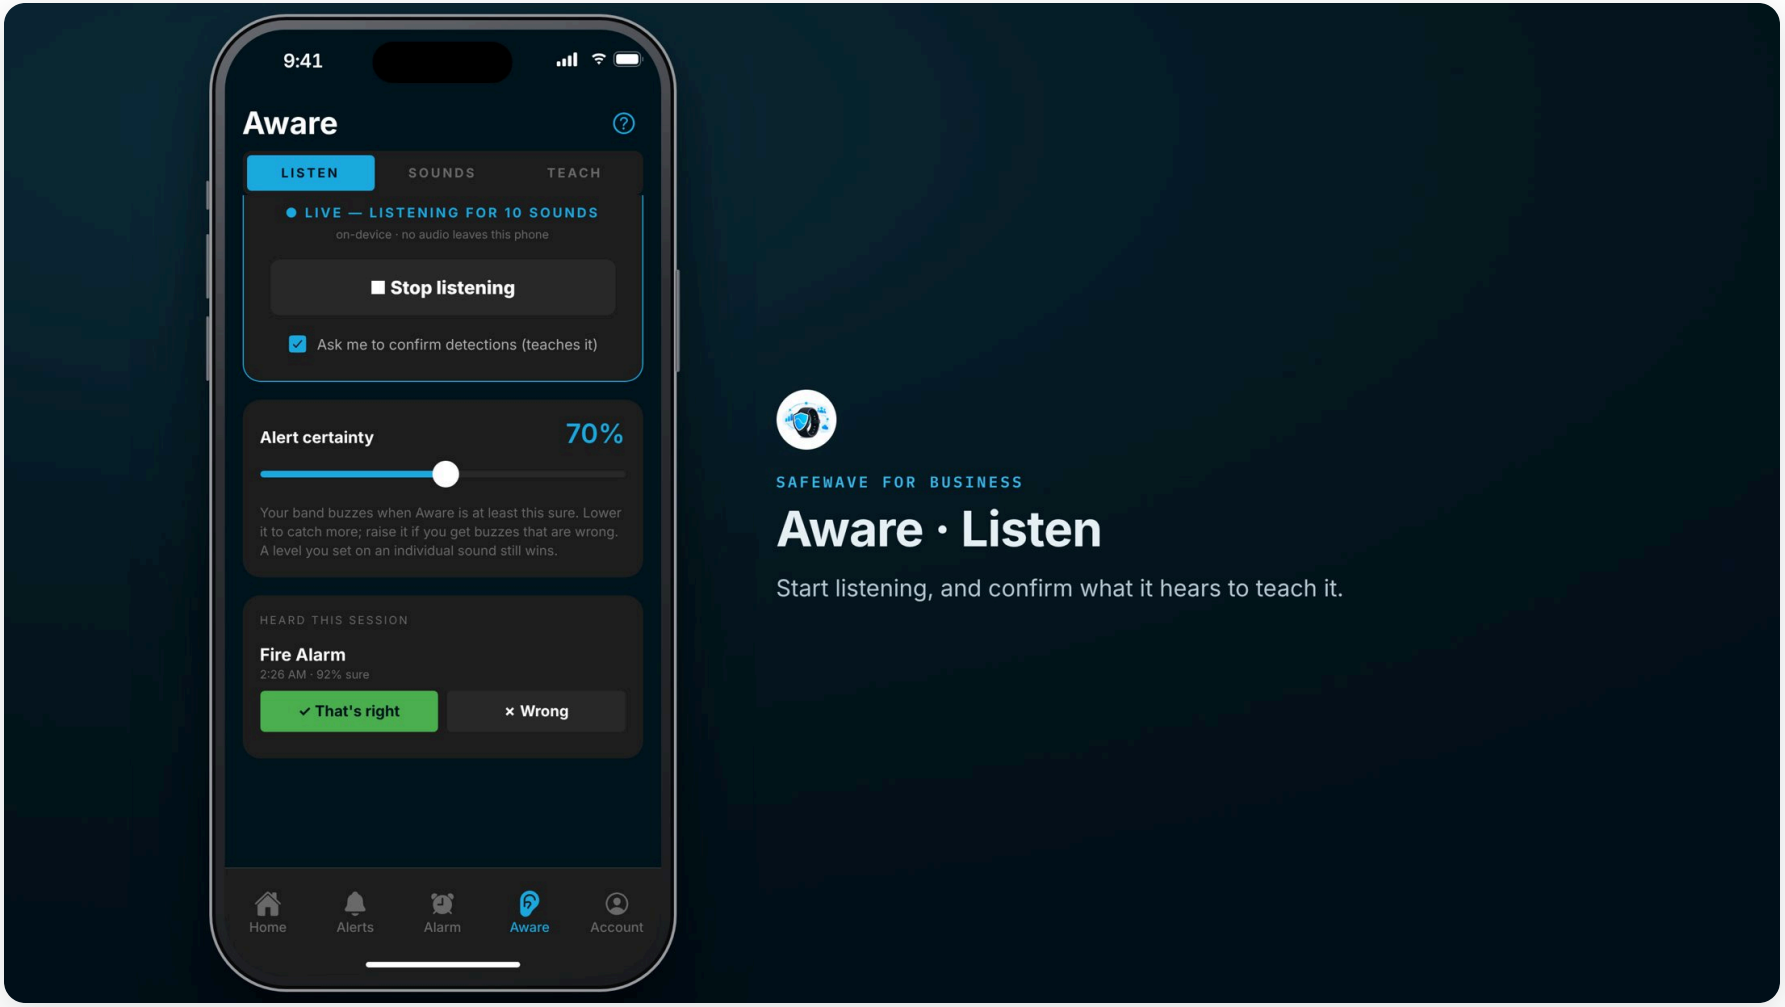

Aware is sound recognition built into Safewave for Business. Open the Aware tab and press Start listening; the phone listens on its own microphone and buzzes the band when it recognizes a sound. Everything is processed on the phone, and no audio leaves it.

Listen: the on switch, how many sounds it is listening for, Ask me to confirm detections, and the alert certainty level.

A fire alarm is heard

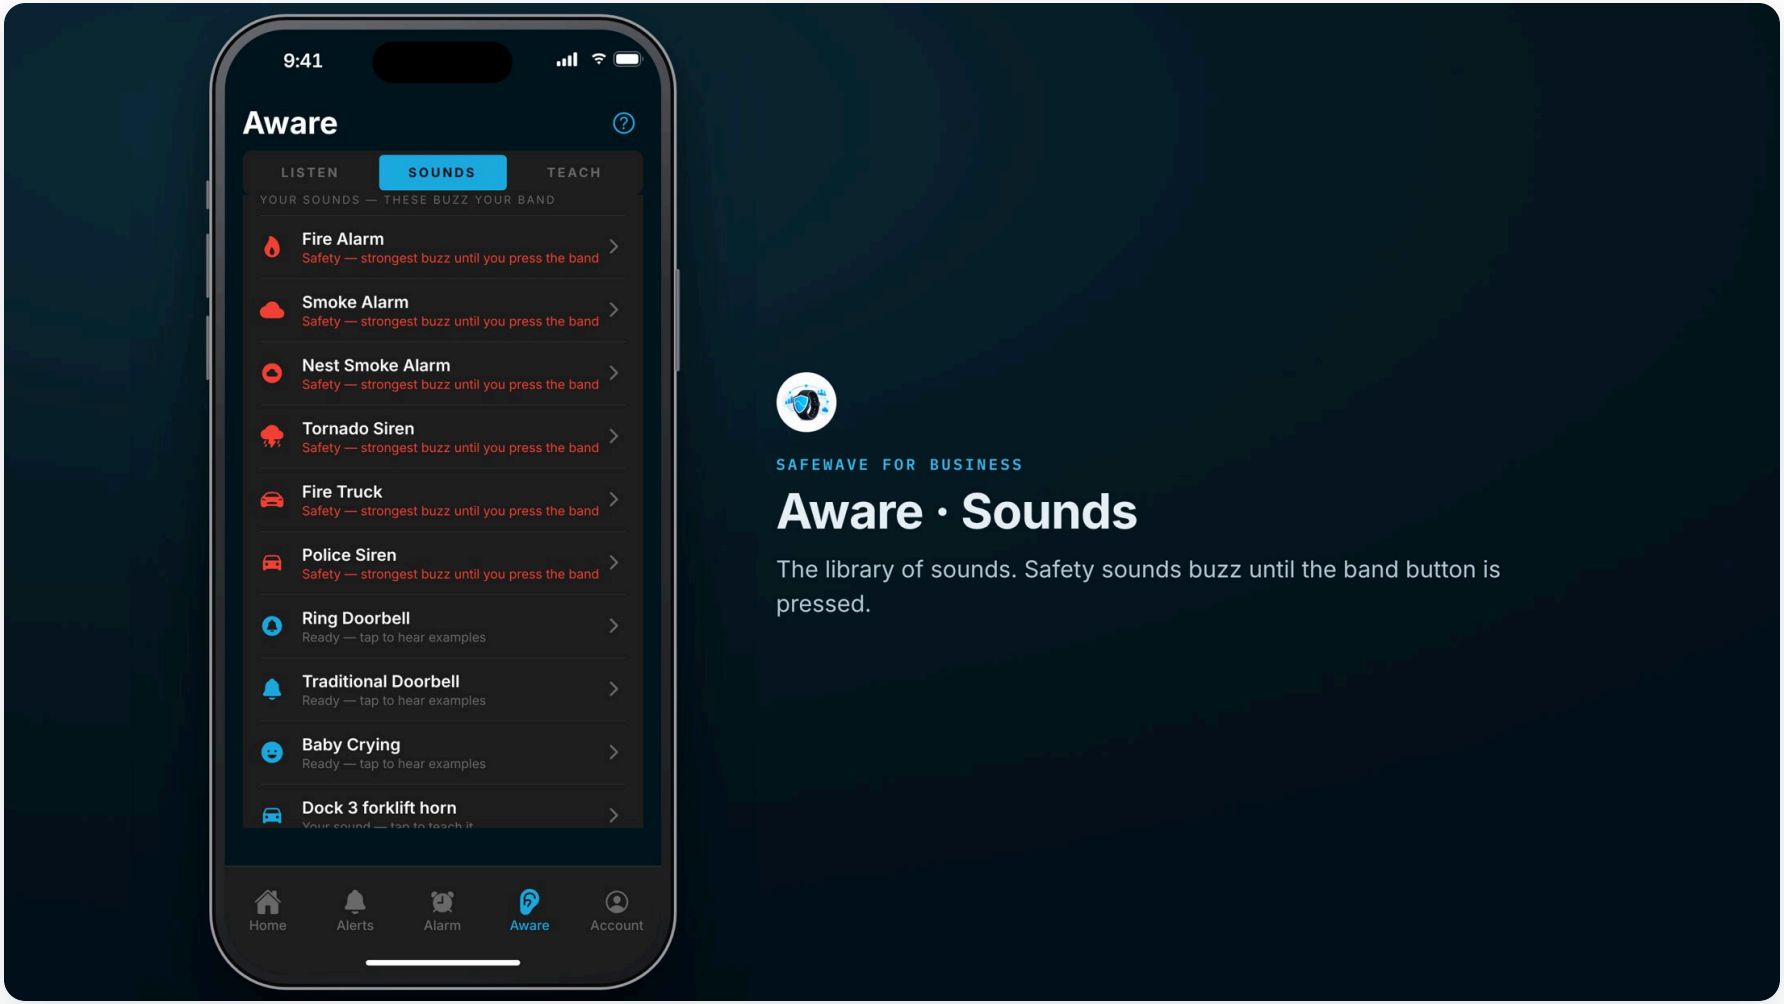

When Aware hears a sound it appears under Heard this session with the time and how sure it was, and the band buzzes. Safety sounds like a fire alarm buzz at full strength until the band button is pressed, the same as a life-safety alert from the dashboard. With confirmations on, tap That’s right or Wrong; each answer teaches it.

Heard this session: Fire Alarm, 92% sure, with That’s right and Wrong.

Choose the sounds

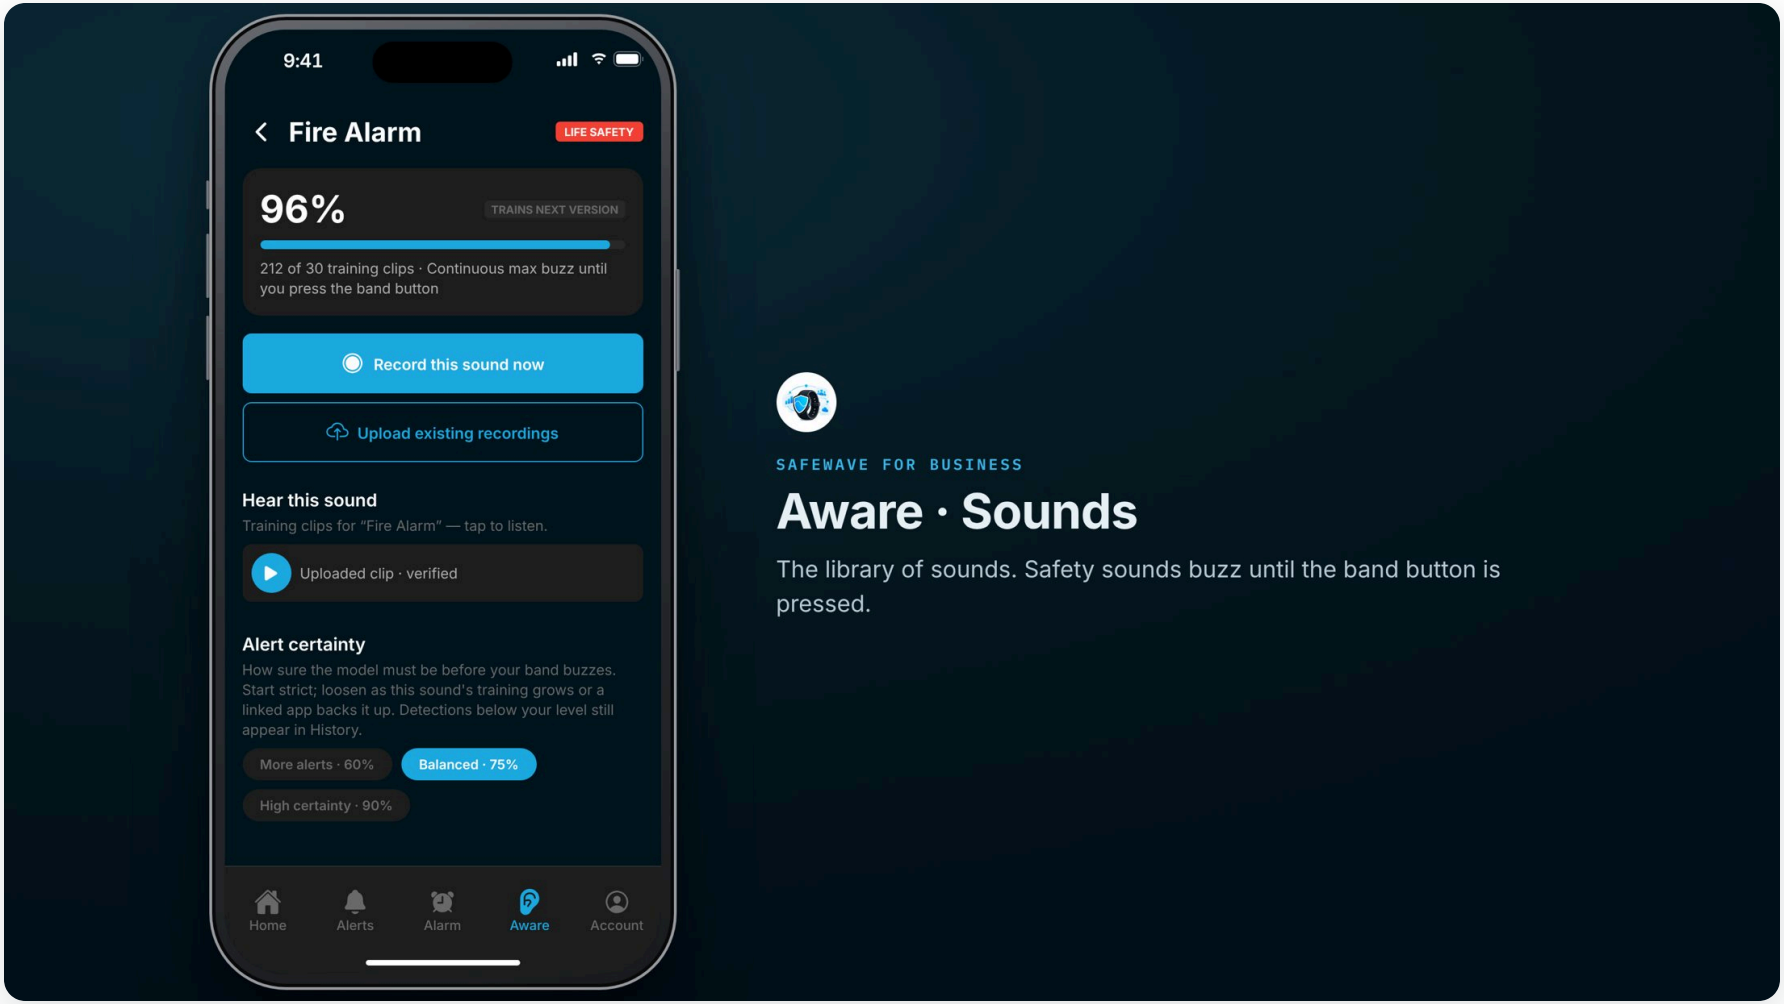

Sounds is the library: fire alarms, smoke alarms, tornado sirens, fire trucks, police sirens, doorbells, a baby crying, and any sounds your site has taught it. The safety sounds are marked and buzz at full strength until the band button is pressed.

Sounds: the ready-trained library, with life-safety sounds marked.

One sound in detail

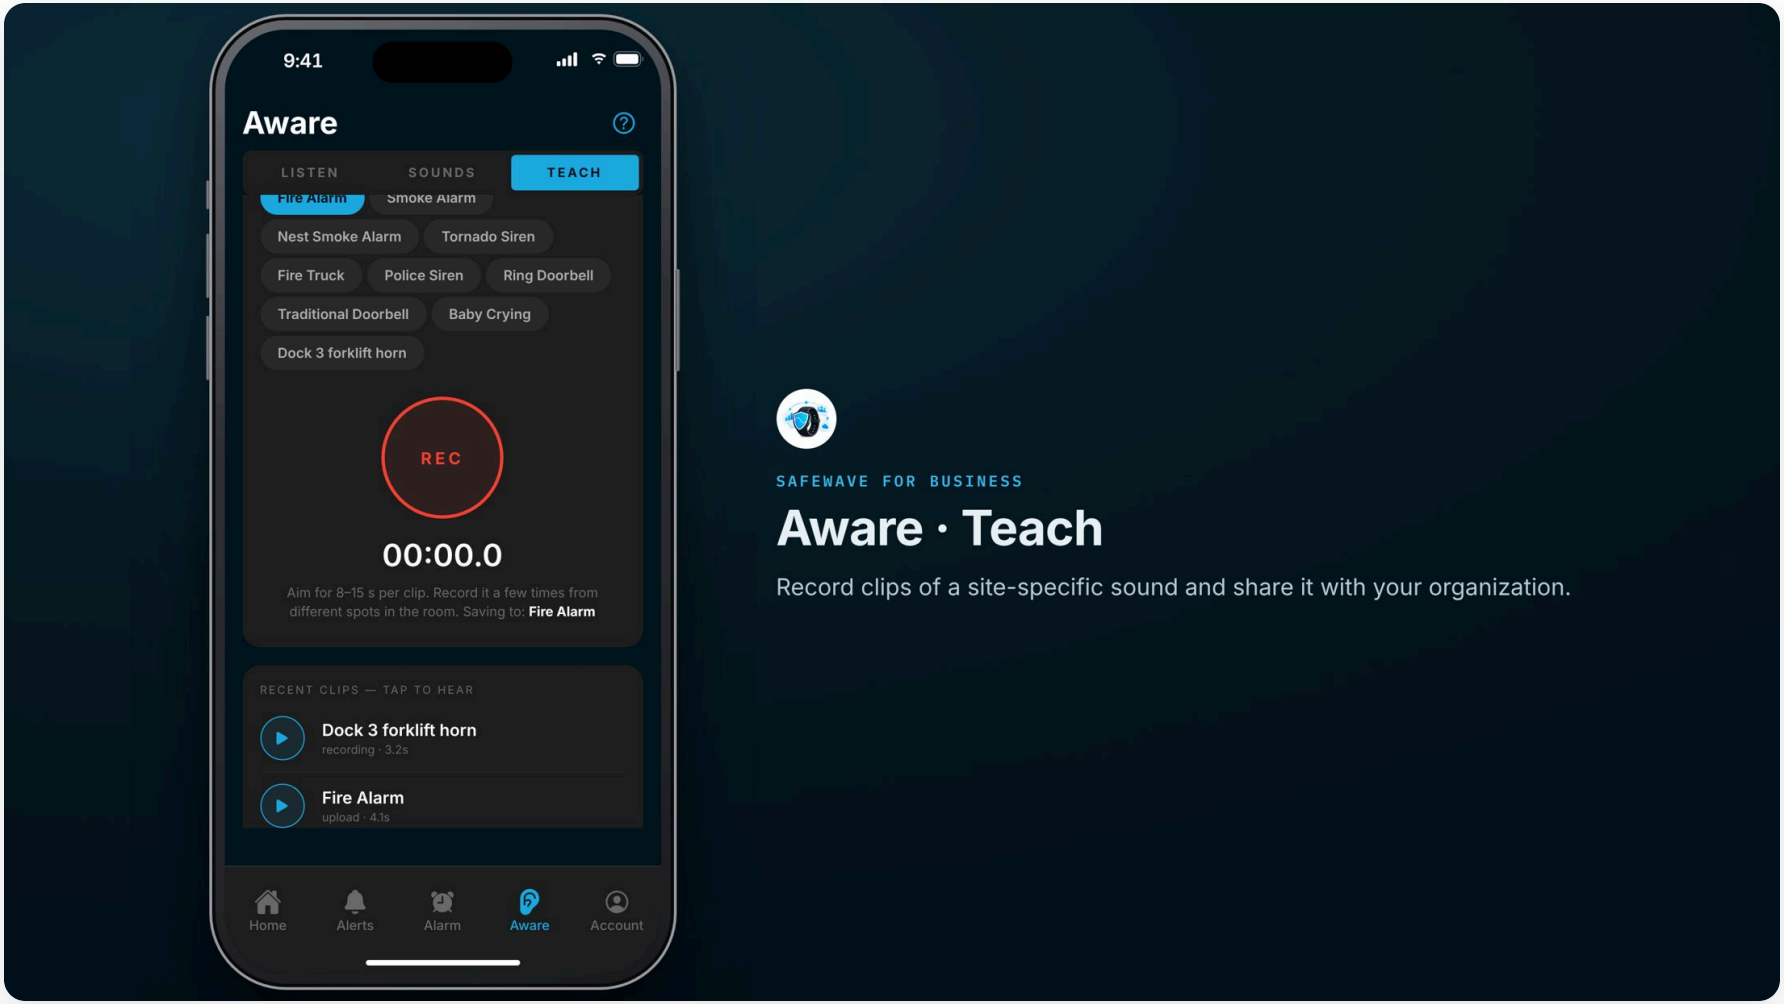

Tap a sound to open it: whether it is life safety, how far its training has come and how many clips it was trained on, its own certainty level, and linked apps like Ring or Nest so a smart-home notification confirms what the microphone heard.

Sound detail: Fire Alarm, life safety, training progress and its own alert certainty.

Teach it your site’s sounds

Teach is for sounds specific to your site, like a forklift horn or a particular machine. Record a few short clips, name the sound, and choose who can use it: just you, your organization, or everyone. Aware learns it and adds it to your sounds.

Teach: pick or add a sound, then record clips.
